Early Jurassic - 200 million years ago  
Connecticut River Valley

Late Jurassic: 150 million years ago  
Hemlock Formation

Late Cretaceous - 67 million years ago  
Hell Creek Formation, Northwestern United States & Canada

**The model:**  
This is a full-sized model of a Tyrannosaurus.  
**The problem:**  
When the age of the earth was first estimated, it was thought that the earth was only about 100 million years old. This meant that the dinosaurs could not have lived as long as the age of the earth was thought to be. This was a problem for the theory of evolution, which suggested that the dinosaurs had evolved from other animals over a long period of time. The discovery of the Tyrannosaurus model helped to solve this problem by showing that the dinosaurs had lived for a much longer period of time than previously thought.
