Matt Combe, Superintendent
Morrow County School District
PO Box 100
Heppner, OR 97836

RE: Morrow County School District – Facilities Assessment

Superintendent Combe,

Wenaha Group is pleased to provide the report for MCSD's Oregon Department of Education (ODE) Facilities Assessment. The Facility Assessment is the first step in the application process for the Oregon School Capital Improvement Matching (OSCIM) Program, which provides grant funding to school districts for capital construction projects.

Wenaha Group partnered with the following firms in compiling this assessment:

- BBT Architects (architectural)
- Morrison Maierle (mechanical, electrical, and plumbing)
- Walker Structural Engineers (structural)

The evaluation team thanks the District staff for their hospitality, time, and support during the evaluation process. It's evident that the District maintenance team and staff put much work into the buildings to create a positive environment for students. Though this Facilities Assessment indicates areas for improvement, we recognize and applaud the care and effort that staff invest into their school buildings, where often they are working with limited resources.

We look forward to continuing this process with the District as we move into the Long Range Facilities Planning (LRFP) phase, where this data forms a shared knowledge base to develop the District's priorities for the future of their facilities.

Sincerely,

Cassie Hibbert
Senior Project Manager

Executive Summary

The facility assessment team visited the district's buildings on February 9, March 7, and March 8, 2024 to gather information for this assessment. The team consisted of Jose Aparicio, Scott Rogers, Cassie Hibbert, Wenaha Group; Renee Alexander, BBT Architects; Eric Webber and Nate Boland, Morrison Maierle; Jonny Walker and Craig Davis; Walker Structural Engineering. ODE certified assessors on the team include Cassie and Scott.

The team met with administrative and/or custodial staff of each school and were accompanied by Brandi Sweeney, Maintenance Coordinator, and Gabriel Hansen, Business Manager.

The following buildings were assessed:

- A.C. Houghton Elementary School
- Heppner Elementary School
- Heppner Junior/Senior High School
- Irrigon Elementary School
- Irrigon Junior/Senior High School
- Riverside Junior/Senior High School
- Sam Boardman Elementary School
- Windy River Elementary School

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
A.C. Houghton Elementary School	1953 w/ additions in 1970, 1995, 2017	46,861	$39,910,965 ($852/SF)	$16,801,527	**42.1%**
Heppner Elementary School (excludes Gym/Cafeteria)	1954 w/ addition in 1997	27,111	$23,090,121 ($852/SF)	$8,749,409	**37.9%**
Heppner Junior/Senior High School (excludes CTE building)	1962 w/ additions in 2001, 2017	59,292	$60,597,963 ($1,022/SF)	$27,743,434	**45.8%**
Irrigon Elementary School	2003	37,594	$32,018,370 ($851/SF)	$4,148,381	**13.0%**
Irrigon Junior/Senior High School (excludes PTE Building)	1978 w/ additions in 1994, 2006, 2011	64,196	$65,609,978 ($1,022/SF)	$30,580,316	**46.6%**
Riverside Junior/Senior High School (excludes CTE building, concessions, maintenance shop)	1968 w/ additions in 1976, 1979, 1980, 1997, 2018	88,760	$90,715,024 ($1,022/SF)	$25,271,679	**27.9%**
Sam Boardman Elementary	1980 w/ additions in 1991, 2017	53,125	$45,245,941 ($852/SF)	$17,387,434	**38.4%**
Windy River Elementary	2003 w/ additions in 2006, 2018	44,130	$37,585,005 ($852/SF)	$4,536,370	**12.1%**

This Facilities Assessment (or Facilities Condition Assessment / FCA) provides a snapshot of current building condition only. The assessment does not include information regarding enrollment/facility capacity or curriculum/program expansion. Those items will be reviewed during an upcoming Long Range Facilities Planning phase.

Replacement Budget per FCA

The Replacement Budget as shown is the cost to replace the current square footage of the existing building with new construction of the same square footage and building type (elementary, high school, etc.). These replacement costs per SF are escalated to mid-2027 costs. The replacement budget includes a state-assigned soft development factor of 1.38 (38%) to cover architect and engineering, permits, survey, bond issuance, management, furnishings, and 15% owner's contingency. It excludes site work and demolition of any existing buildings.

Elementary School replacement cost (escalated to mid-2027)	$852/SF
High School replacement cost (escalated to mid-2027)	$1,022/SF

Physical Condition Budget Total

The Physical Condition Budget Total is cost to bring existing building up to original condition based on a line item evaluation. This cost is not equivalent to a "gut remodel" of a building. Costs as shown do not include costs to introduce new systems such as ventilation, safety/security upgrades, change the use of building space, add square footage, nor to improve ADA or provide seismic retrofit.

Costs within the FCA have been escalated to mid-2027. Cost information in this assessment report is for general information only and should not be used for budgeting purposes.

The physical condition budget includes a state-assigned soft development factor of 1.38 (38%) to cover architect and engineering, permits, survey, bond issuance, management, furnishings, and 15% owner's contingency.

Wenaha Group strongly recommends that costs for potential projects are verified with a contractor or independent cost estimator specifically for the location and market conditions in Morrow County. Cost should also be evaluated holistically with proposed projects; an example is a FCA line item showing an air handler replacement in an attic. The line item indicates the replacement of the equipment, but a access hatch may need to be cut in the ceiling or roof for the equipment, with finish patch and repair.

Facility Condition Index (FCI)

The Facility Condition Index (FCI) is a metric that compares the total cost of existing deficiencies divided by the Replacement Value per the FCA.

FCI at or greater than 31% is the threshold for if a District should consider a replacement as part of their planning process. The FCI does not take into account historic preservation considerations, nor are some communities able to bond the amount of a full building replacement.

Facilities Assessment Requirements

The following text is from the Oregon Administrative Rules (OAR) at https://secure.sos.state.or.us.
OAR 581-027-0035 is the governing rule regarding the content of the Facility Assessment.

Each Facility Assessment shall contain:

(1) Name of Building.
(2) Building ID Number.
(3) Physical Address.
(4) Gross Square Footage.
(5) Original Construction Date.
(6) Original Construction Type.
(7) Additions:
  (a) Construction Date;
  (b) Construction Type;
  (c) Construction Square footage; and
  (d) Addition Construction Usage.
(8) Renovations:
  (a) Construction Date;
  (b) Construction Type;
  (c) Construction Square Footage; and
  (d) Renovation Construction Usage.
(9) UNIFORMAT II Infrastructure Assessment: An assessment of each applicable building element as listed in the American Society for Testing and Materials (ASTM) UNIFORMAT II Classification (October 1999) of Building Elements Level 3 that provides the following:
  (a) ASTM Number;
  (b) System Name;
  (c) Description of System;
  (d) Number of systems or square footage of system in need of repair or want of replacement;
  (e) Level of repair/replacement needed. The percent of the building affected should be noted to assist in cost estimating; and
  (f) Notes as to what specifically needs to be done to repair or replace the system.
(10) Additional items:
  (a) A safety and security analysis of the facility that determines if the facility meets current best practices for providing a safe and secure environment;
  (b) An ADA assessment and listing of deficiencies;
  (c) Assessment of technology infrastructure in the facility including bandwidth, type of internet connection, presence of wireless networks, and other means of providing access to information technology;
  (d) Assessment of indoor air quality; and
  (e) Presence of harmful substances such as lead or asbestos in the facility based on District reports.
(11) Value Assessment:
  (a) The current replacement value of the building using cost per square foot standards as determined by the Department and updated annually; and
  (b) The Facilities Condition Index of the building as calculated by dividing the total estimated construction costs to completely repair the building by the current replacement value of the building.
(12) All information submitted electronically to the Department on a Department-established template which shall be used by Districts and Certified Assessors.

Information Provided to Evaluation Team

The evaluation team was provided with the following information from the District:

- 2019 Facilities Assessment
- 2020 Long Range Facilities Planning (LRFP) Report
- Existing drawings and as-built documents for all schools

Summary of District Buildings

Morrow County SD owns the following buildings as listed in the Building Collection file. The following information was obtained on March 12, 2024 via the ODE Building Collection database.

ODE Bldg ID	Building Name	Address	City	Evaluated during 2024 Facilities Assessment?
21470100	A.C. Houghton Elementary	1105 North Main Avenue	Irrigon	Yes
21470300	Heppner Elementary	235 East Stansbury Street	Heppner	Yes
21470301	HES Gym/Cafeteria	235 East Stansbury Street	Heppner	No
21470500	Heppner High School	710 NW Morgan Street	Heppner	Yes
21470501	Heppner High Vo-Ag/Shop Building	710 NW Morgan Street	Heppner	No
21470502	Heppner High Track Shed	710 NW Morgan Street	Heppner	No
21470800	Irrigon Elementary	490 SE Wyoming	Irrigon	Yes
21470801	Irrigon Elementary Modular	490 SE Wyoming	Irrigon	No
21470400	Irrigon High School	315 East Wyoming Avenue	Irrigon	Yes
21470401	Irrigon High School/PTE Building	315 East Wyoming Avenue	Irrigon	No
21470402	Irrigon HS Concession	315 East Wyoming Avenue	Irrigon	No
21470403	Irrigon High School Maintenance Shop	315 East Wyoming Avenue	Irrigon	No
21470900	Morrow Education Center	240 Columbia Lane	Irrigon	No
21470600	Riverside High School	210 Boardman Avenue	Boardman	Yes
21470601	Riverside HS Shop Ag Building	210 Boardman Avenue	Boardman	No
21470602	Riverside Multi Purpose Building	210 Boardman Avenue	Boardman	No
21470603	Riverside HS Bus Shop	230 Boardman Avenue	Boardman	No
21470604	Riverside HS Concession	210 Boardman Avenue	Boardman	No
21470605	Riverside HS Track Shed	210 Boardman Avenue	Boardman	No
21470606	Riverside Announcers Booth	210 Boardman Avenue	Boardman	No
21470200	Sam Boardman Elementary	301 Wilson Lane	Boardman	Yes
21470201	Sam Boardman Elem Storage Building	301 Wilson Lane	Boardman	No
21470700	Windy River Elementary	500 Tatone Street	Boardman	Yes
21470000	District Office North Modular Building	240 Columbia Lane	Irrigon	No

General Observations

The following are general observations made by the assessment team. These items are not intended to be all-inclusive. Please refer to the appendices for further information on each school. These general observations are suggested as potential projects for the District to consider as they move into the Long Range Facilities Planning phase.

A.C. Houghton Elementary School

10-year average enrollment: 248
Staff members (approximate): 41

- In general, this facility is at the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.
- At this site the parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.
- On the exterior the siding needs repair and repaint; soffits and fascias have damage from either water and/or bird nesting.
- On the interior most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced.
- Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget). In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.
- No major structural concerns were observed.
- One boiler appears to have been replaced in recent years and still has some years of operable life left with proper maintenance. The chillers appear to be at the end of their useful life.
- The classrooms are heated and cooled with a wall mounted unit ventilators consisting of hot water and chilled water coils, a fan, and a thermostat for control. The unit ventilators were installed in 2010 and have a 15 year median life.
- The cafeteria and kitchen had new air handling equipment installed in recent years.
- The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.

Front entry

- There is no fire protection system within the building.
- It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. The existing domestic water piping appears to be galvanized piping and in poor condition.
- There are several newer domestic hot water heaters within the building mostly located in janitor rooms.
- Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.
- The main electrical distribution equipment is a Circle Products fused switchboard and is original to the building at the end of its usable life. Branch panelboards appear to be of the same age as the main distribution equipment and at the end of its usable life. The electrical distribution equipment throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits.

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
A.C. Houghton Elementary School	1953 w/ additions in 1970, 1995, 2017	46,861	$39,910,965 ($852/SF)	$16,801,527	**42.1%**

- There is an existing generator at the facility which is assumed to have been installed under the Chemical Stockpile Emergency Preparedness Program (CSEPP), related to the Umatilla Chemical Depot. The generator did not appear to have been maintained or functional.
- The existing receptacle quantities and locations throughout the building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.
- Lighting throughout the building generally consisted of fluorescent light source type fixtures in fair to poor condition.
- Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.
- The existing Simplex 4010 horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements.
- The main distribution frame was observed during the facility tour which consisted of (1) two post rack to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.
- Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building and it was noted that network connectivity is adequate. Structured cabling observed consisted of a mix of Category 5e and 6 grade.
- The existing paging system was not tested during the tour; however, it was noted by facilities that the existing head-end is operational but does not integrate with the phone system and is obsolete without spare parts or maintenance technicians available. Lapses in paging coverage throughout the building were also noted. The building centralized clock system has continual maintenance and synchronization issues.
- A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.
- No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- No intrusion detection system was observed.

Heppner Elementary School

10-year average enrollment: 178
Staff members (approximate): 28

- In general, the original facility is nearing the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected in both the exterior and interior. The newer Gym facility is in fair condition and has been well maintained.
- At this site the parking, driveways, sidewalks, and curbs need repairs, repaving, and restriping. Limited ADA access. Lack of security fencing. City Street separates the original building and the gym building, which adds to the security concerns.
- The exterior of the main building, the siding needs repair and repaint; soffits and fascias have damage from either water and/or bird nesting.
- On the exterior of the gym building the soffits and fascias have damage from bird nesting.
- The interior of the main building needs most of the flooring and rubber base needs replaced; most of the acoustical ceiling tile needs replaced; most doors, door hardware and thresholds do not meet ADA; no secure vestibule or secure campus; many ADA issues especially around the toilets; most cabinets need to be replaced.
- The interior of the gym building is in general, in good condition with minor upgrades and repairs needed.
- Any significant upgrade to original building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget) In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.
- In general, the overall condition of the school is good. No major structural concerns were observed.
- Multiple large pipes extend down the hallway with no diagonal seismic bracing.
- A downspout adjacent to the main entry on the Southwest side of the structure discharges into the planter area and is not properly piped away from the structure with storm drainage. Prolonged infiltration of water next to building foundations can eventually result in settlement issues.
- A larger crack exists above the door to the Boiler Room in the downstairs hallway.
- Mortar has deteriorated in the brick on the West face of the building below the large glass block area.

Front entry

- Minor cracking exists in the sheetrock at both levels but does not appear to be settlement cracks. In general, gapping around doors appears consistent.
- The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. It appears the boilers are well beyond their serviceable life. The boilers utilize fuel oil (diesel) as a fuel source.
- There is a single air-cooled chiller that provide chilled water for the building, which appears to be original to the building is located on grade and is at the end of operable life.
- Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation and has been repaired or replaced in recent years.
- The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.
- There is no fire protection system within the building.
- It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. There appears to be some damaged piping that has been repaired over the years. There are several domestic hot water heaters within the building, mostly located in janitor rooms. Some existing domestic hot water heaters have been replaced.

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
Heppner Elementary School (excludes Gym/Cafeteria)	1954 w/ addition in 1997	27,111	$23,090,121 ($852/SF)	$8,749,409	**37.9%**

- Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.
- The main distribution equipment with the incoming electrical service feeder was installed in the 1995 addition and used to back feed the original distribution equipment. The 1995 equipment is a Siemens type S5 distribution board and is in good working condition with plenty of usable life remaining at 27 years old. The associated branch panelboards installed in the 1995 addition appeared to be in good working condition with spare capacity.
- The distribution equipment original to the building and back fed from the 1995 equipment is a Square D fused switchboard and at the end of its usable life at 69 years old. The associated branch panelboards fed from this equipment are of the same age and have little to no spare capacity for additional circuits. The facility personnel noted power capacity issues within the original building.
- The distribution equipment within the stand-alone gym building consists of Siemens type P1 panelboards and is in good working condition with plenty of usable life remaining at 22 years old. The associated branch panelboards and step-down transformers installed in the gym building appeared to be in good working condition with spare capacity.
- The existing receptacle quantities and locations throughout the original building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.
- The existing receptacle quantities and locations throughout the 1995 addition and gym building appeared to be adequate for the current program needs.
- Within the original building, lighting generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Minimal emergency lighting was observed; based on the observed spacing, it is questionable whether the current spacing meets code minimum illumination requirements. No automatic lighting controls or dimming was observed in the original building.
- Within the 1995 addition and gym building, lighting generally consisted of fluorescent and HID light source type fixtures in good condition. Exterior parking lot lighting South of the gym building utilized metal halide bulbs and appeared to be in good condition. Some automatic lighting controls were observed in the 1995 addition. No dimming was observed.
- Within the original building, the existing Edwards LSS4 fire alarm control panel is at the end of its usable life. The existing notification/detection devices throughout the original building are of the same age.
- The 1995 addition utilizes a Silent Knight zone communicator interfaced with the original building fire alarm control panel. The gym building has a Silent Knight 5808 fire alarm control panel installed and appeared to be in good working condition.
- The main distribution frame and intermediate distribution frames were observed during the tour. This included two post and wall mount racks within the original building, 1995 addition and gym building. This equipment was in good condition and had spare physical capacity for expansion.
- The existing data outlet quantities and locations throughout the building, specifically in classrooms, varied by location. Spaces within the 1995 addition and gym building appeared to have adequate data infrastructure to support wireless

access points, IP phones and other space needs. Spaces within the original building had minimal infrastructure and appeared to be inadequate to support space needs. Structured cabling observed consisted of a mix of Category 5e and 6 grade. Within the original building, structured cabling did not appear to be supported and/or protected properly.
- The existing paging system was not tested during the tour; however, the existing head-end within the original building is aged and it was noted by facility personnel that there are lapses in coverage throughout the building. The clock system is obsolete and non-functional.
- A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appears to be in good working condition.
- No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- No intrusion detection system was observed.

Heppner Junior/Senior High School

10-year average enrollment: 160
Staff members (approximate): 27

- In general, this facility is nearing the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected in both the exterior and interior.
- At this site the parking, driveways, sidewalks, and curbs need repairs, repaving, and restriping. Limited ADA access. Lack of security fencing.
- At the exterior of the main building the siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.
- At the CTE building the siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.
- The interior of the main building most of the flooring and rubber base needs replaced; most of the acoustical ceiling tile needs replaced; most doors, door hardware and thresholds do not meet ADA; no secure vestibule or secure campus; many ADA issues especially around the toilets; most cabinets need to be replaced.
- The interior of the CTE building the Entire building lacks ADA upgrades including access from main building; Fire code/exiting concerns especially in the larger labs; non-working dust collection system and general safety concerns in both labs.
- Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget) In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.

Front entry

- Several concrete pilasters in large crawl space have damage at the corners and rusted reinforcing. Additionally, storm drainage is currently flowing through this crawl space and adjacent to these pilasters and footings below.
- Glulam floor beams for classrooms above were installed upside down with "Top" being visible from the bottom of the beam.
- Significant damage has occurred where the guard rail at the exterior ramp attached to the concrete wall on the South end of the Gymnasium.
- There are signs of roof leaks due to visible stained ceiling tiles in the small wrestling room & band room.
- Upstairs classrooms and hallways look good with minimal cracks in sheet rock and proper gapping at doors.
- Shop building structure appears in good condition

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
Heppner Junior/Senior High School	1962 w/ additions in 2001, 2017	59,292	$60,597,963 ($1,022/SF)	$27,743,434	**45.8%**

with limited cracking in the exterior CMU and Concrete walls.

- Upper mezzanine framing at the Gymnasium where current weight room exists is unknown as the ceiling is sheathed with OSB and existing drawings are unavailable. Problems have occurred at other High Schools with weight rooms on the second level due to impact loading from heavy barbells being dropped.
- The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. It appears some boilers have been replaced. The boilers utilize propane as a fuel source, and it has been reported that the propane is causing fouling within the boilers.
- There is a single air-cooled chillers that provide chilled water for the building, which appears to be original to the building is located on grade and is at the end of operable life.
- Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation and has been repaired or replaced in recent years.
- The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.
- There is no fire protection system within the building.
- It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. There appears to be some damaged piping that has been repaired over the years. There are several domestic hot water heaters within the building, mostly located in janitor rooms. Some existing domestic hot water heaters have been replaced.
- Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.
- The existing main distribution equipment is a Coast Electric fused switchboard original to the building and at the end of its usable life at 62 years old. This equipment is located within the existing crawlspace exposed to non-ideal environmental conditions. Distribution boards and branch panelboards are generally of the same age, with some newer equipment that has been added over time to support new loads. The electrical distribution throughout the main building appeared to be full, with minimal spare capacity for additional circuits. There are (3) single phase utility step-down transformers that provide 3-phase service to the building.
- The existing distribution equipment in the Shop Building is fed from the main building's electrical service. This equipment is a Circle Products fused switchboard, original to the building and nearing the end of its usable life at 48 years old. The Shop Building distribution equipment appeared to be full, with minimal spare capacity for additional circuits.
- No existing generator was observed.
- The existing receptacle quantities and locations throughout the main building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.
- Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. Several instances of yellowing fixtures were observed, due to degradation over time. Exterior parking lot and building mount site lighting is minimal, in poor condition and does not provide adequate illumination. The emergency lighting source throughout the building was not observed — no bug-eye, centralized inverter, or light fixtures with indicator lights were observed; it is unknown whether the current emergency lighting configuration throughout the building meets code minimum illumination requirements. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.
- The existing Edwards 2400 series fire alarm control panel is at the end of its usable life;

facility personnel noted recurring false alarms and maintenance issues. No notification or detection was observed in classrooms. Notification and detection devices were observed in corridors; however, it is possible that the current spacing and layout may not meet modern building code based on the observed locations.
- The main distribution frame and intermediate distribution frames were observed during the facility tour which consisted of (2) two post racks and multiple wall mount racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.
- Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building and it was noted that network connectivity is adequate. Structured cabling observed consisted of a mix of Category 5e and 6 grade. In general, structured cabling did not appear to be supported and/or protected properly.
- The existing paging system was not tested during the tour; however, the existing head-end is aged, and it was noted by facility personnel that there are lapses in coverage and some maintenance issues with speakers throughout the building. The existing clock system is not functional.
- The existing video surveillance system is an analog system that is at the end of its usable life.
- No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- No intrusion detection system was observed.

Irrigon Elementary School

10-year average enrollment: 193
Staff members (approximate): 29

- This is a newer building for the district and overall, the school is well maintained. However, minor wear and tear is reflected in both the exterior and interior.
- The site currently lacks security fencing.
- At the building exterior, the soffits and fascias have damage from either water and/or bird nesting.
- The main building entrance does not have a secure vestibule.
- No major structural concerns were observed.
- On the East side of the gymnasium at the restroom walls, there was some cracking occurring in the CMU walls that appears to be due to settlement.
- The boilers appear to be original and installed in 2002 and may still have some years of operable life left with proper maintenance.
- There is one air cooled chillers that provides chilled water for the building. The first chiller, which appears to be original to the building is located on grade and is nearing the end of its operable life. Hot and chilled-water distribution piping appears to be in decent condition with the exception that the existing Victaulic fittings leak when the hot water system is turned off during the summer.
- The existing air handling units, ductwork, and VAV

Front entry

boxes appear to be in good working order.
- It appears that an existing DDC control system has been installed within the building but may not be working well.
- There is fire sprinkler piping installed within the building and appears to be in good working order and up to current code.
- Plumbing piping appears to be in good condition.
- Plumbing fixtures appear to be in good working order. Existing showers do not appear to be used

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
Irrigon Elementary School	2003	37,594	$32,018,370 ($851/SF)	$4,148,381	**13.0%**

and non-operable. Some ADA fixtures installed.

- The existing main distribution equipment is in good condition with plenty of usable life remaining at approximately 22 years old. The existing branch panelboards are of similar age as the main distribution equipment. Both the main distribution equipment and branch panelboards appeared to have physical capacity to accommodate future circuits.
- There is an existing generator at the facility which is assumed to have been installed under the CSEPP program. The generator did not appear to have been maintained or functional.
- The existing receptacle quantities and locations throughout the building appeared to be adequate in supporting the current space needs.
- Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in good condition.
- Exterior parking lot and building mount site lighting appeared to be adequate, in good condition and likely provides adequate illumination.
- Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.
- The existing Simplex 4010 horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements.
- The main distribution frame was observed during the facility tour which consisted of (2) two post racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.
- The existing receptacle quantities and locations throughout the building appeared to be adequate in supporting the current space needs.
- The existing paging system was not tested during the tour; however, no deficiencies were noted by the facility personnel. The system is assumed to be in good working order. The existing clock system appeared to be functional and in good working order.
- A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.
- No centralized access control system was observed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- No intrusion detection system was observed.

Irrigon Junior/Senior High School

10-year average enrollment: 378
Staff members (approximate): 45

- In general, this facility is at the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.
- In portions of the main building problems with the precast concrete walls, beams and double tee roof members were observed. This includes major cracking in support beams, spallling and breakout of parts of the precast walls at tops of wall, and cracks at bearing ends of the double tee roof members.
- On this site the parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.
- The main building exterior lacks windows; siding needs repair and repaint; soffits and fascias have damage from either water and/or bird nesting.
- The annex lacks Windows; siding needs repair and repaint; soffits and fascias have damage from either water and/or bird nesting.
- In the interior of the building most of the flooring and rubber base needs replaced; most of the acoustical ceiling tile needs replaced; most doors, door hardware and thresholds do not meet ADA; no secure vestibule or secure campus; many ADA issues especially around the toilets; most cabinets need to be replaced.
- Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget) In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.
- The newer Agricultural building and the West side wood framed addition to the main building are in great condition.
- At the mechanical mezzanine above the locker rooms, there is water damage to the floor sheathing underneath (2) water heaters. This appears to have been leaking some water in the past. It is unknown if the leak in this area is still a problem.
- There is a roof top mechanical unit above the gymnasium/mechanical mezzanine that sits on a steel frame supported atop the parapet. This does not appear to be adequately supported and

Front entry

it is generally advised not to support equipment on parapets. In a seismic event, the parapet may not be adequate to support the unit causing it to collapse on the upper or lower sloped roof.
- The boilers appear to have been replaced in 2002 and still have some years of operable life left with proper maintenance.
- There are two air cooled chillers that provide chilled water for the building. The first chiller, which appears to be original to the building is located on grade and is at the end of operable life. The second chiller is located on the roof, adjacent to the newest addition. This chiller appears to be in newer condition and still may have additional years of operational life. Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation.
- The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.
- There is no fire protection system within the building.
- It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. It was noted that the sanitary piping often struggles to drain and may be damaged in some areas.
- Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.
- The existing main electrical distribution equipment

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
Irrigon Junior/Senior High School (excludes PTE Building)	1978 w/ additions in 1994, 2006, 2011	64,196	$65,609,978 ($1,022/SF)	$30,580,316	**46.6%**

is original to the building nearing the end of its usable life at 45 years old. The electrical room hosting the distribution gear is suffering from structural damage which impacts overall safety around the equipment. Distribution boards, step-down transformers and branch panelboards appear to be of the same age as the main distribution equipment. The electrical distribution equipment throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits.

- There is an existing generator at the facility which is assumed to have been installed under the CSEPP program. The generator did not appear to have been maintained or functional.
- The existing receptacle quantities and locations throughout the building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.
- Lighting throughout the building generally consisted of fluorescent light source type fixtures in fair to poor condition.
- Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination.
- Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.
- The fire alarm control panel had been upgraded to a modern Simplex 4100ES system; however, it did not appear that the upgrades were extended to notification/detection devices throughout the building. The existing notification/detection devices appeared to be at the end of their usable life. Lapses in detection and notification coverage were observed in some of the toured spaces. The building has experienced nuisance alarms and maintenance challenges with the proprietary fire alarm system.
- Multiple network distribution frames were observed during the facility tour. These consisted of a mix of two post and wall mounted racks to support structured cabling and network hardware. In general, these appeared to be in good working condition, but had limited physical capacity for expansion.
- Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building and it was noted that network connectivity is adequate. Structured cabling observed consisted of a mix of Category 5e and 6 grade.
- The existing paging system was not tested during the tour; however, it was noted by facilities that the existing head-end is operational but is increasingly unreliable and there are lapses in coverage throughout the building. No building centralized clock system is installed.
- A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.
- No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- There is an existing intrusion detection system which covers the main office and library only. Facility personnel noted false tripping and functionality issues with the existing system.

Riverside Junior/Senior High School

10-year average enrollment: 444
Staff members (approximate): 54

- In general, this facility is nearing the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.
- At this site the parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.
- The exterior of the main building the siding needs repair and repaint; soffits and fascias have damage from either water and/or bird nesting. Roof has drainage concerns and kalwall skylights in commons area appear to be failing.
- The exterior of the CTE building the siding needs repair and repaint; soffits and fascias have damage from either water and/or bird nesting.
- The exterior of the wrestling barn is a newer metal building in fair/good shape.
- The interior of the main building most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced. In the Science area there are major concerns around fire code/exiting out of internal classrooms.
- The interior of the CTE building the entire building lacks ADA upgrades (including access from main building); Fire code/exiting concerns especially in the larger labs; non-working dust collection system and general safety concerns in both labs.
- The interior of the wrestling barn is in good condition; minor repairs may be needed.
- Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget) In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.
- No major structural concerns were observed.
- There are multiple areas where roof downspouts discharge at the base of the walls and do not pipe away from the building. In addition, the grading of the landscape generally slopes toward the building at these areas. Prolonged infiltration of water next to building foundations can eventually result in settlement issues.
- Outside the North side of the gym doors, there is a wall spigot that is dripping and has been dripping for quite some time. This is up against the foundation and part of the adjacent short retaining wall. Prolonged infiltration of water next to building foundations can eventually result in settlement issues.
- There are multiple lath and plaster type walls in the Boys and Girls locker rooms that are deteriorating due to moisture around the shower areas. These walls are non-structural, however they are still a concern as they are separation walls in the locker rooms.
- The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. It appears some boilers have been replaced while others are either original to the building or long past their usable life.
- There are two air cooled chillers that provide chilled water for the building. The first chiller, which appears to be original to the building is located on grade and is at the end of operable life. The second chiller is also located on grade, adjacent to the newest addition. This chiller appears to be in newer condition and still may have additional years of operational life.
- Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation and has been repair or replaced in recent years.
- The classrooms are served by large centralized air

Student commons / front lobby

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
Riverside Junior/Senior High School (excludes CTE building, concessions, maintenance shop)	1968 w/ additions in 1976, 1979, 1980, 1997, 2018	88,760	$90,715,024 ($1,022/SF)	$25,271,679	**27.9%**

handling equipment ducted to each classroom. Some of the air handling units appear to be newer and in good working order.
- Wrestling barn is served by a single zone ground mounted air handling unit with exterior ductwork.
- Welding shop appears to have a new exhaust system installed. Wood shop has an existing exhaust system but the duct collection system appears to be old and not up to current codes.
- The cafeteria and offices in the central portion of the school have a new air handling unit and VRF system.
- The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.
- There is no fire protection system within the building.
- Plumbing piping appears to be original to the building. It was reported that the existing plumbing piping has many leaks and is in poor condition. There are many existing domestic hot water heaters through the buildings. Some have been replaced and appear new, others are very old and at the end of their serviceable life.
- Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.
- The existing main electrical distribution equipment is a Westinghouse switchboard board and is original to the building at the end of its usable life at 56 years old. The electrical distribution equipment throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits. A second utility meter and CT cabinet were observed; this equipment appeared to serve a single mechanical unit on the Northeast side of the property.
- A third utility meter was observed on site to serve the AG shop building. The distribution equipment serving this building is a GE fused switchboard and appeared to be approaching the end of its usable life. The electrical distribution equipment throughout the AG shop building generally appeared to be full, with minimal spare capacity for additional circuits.
- The existing receptacle quantities and locations throughout the main building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs. Faculty noted that the branch power devices in the AG shop building were inadequate for current program needs.
- Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. Several instances of yellowing fixtures were observed, due to degradation over time.
- Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Bug-eye type fixtures provide emergency lighting throughout the building; based on the observed spacing, it is questionable whether the current spacing meets code minimum illumination requirements.
- Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.
- The existing Unimode 9600UDLS horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements in the spaces toured.
- Multiple network distribution frames were observed during the facility tour. In general, these appeared to be in good working condition and had some physical capacity for expansion. One wall mounted network rack observed was located within a mechanical space and exposed to poor environmental conditions.

- Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building. Structured cabling observed consisted of a mix of Category 5e and 6 grade. In general, structured cabling did not appear to be supported and/or protected properly.
- The existing paging system was not tested during the tour; however, the facility personnel noted that the head-end is in good working order. Minor deficiencies such as general speaker maintenance and lapse of coverage in select locations were noted. The existing American Time & Signal clocks observed were in good working condition.
- A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.
- No centralized access control system was observed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- No intrusion detection system was observed.

Sam Boardman Elementary School

10-year average enrollment: 339
Staff members (approximate): 57

- In general, this facility is nearing the end of its life cycle. It has had a few remodels and additions, and some upgrades have been completed to update finishes and update general cosmetic conditions. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.
- At this site the parking, driveways, sidewalks, and curbs need repairs, repaving, and restriping. Limited ADA access. Lack of security fencing.
- On the exterior the masonry is in generally good condition; soffits and fascias have damage from either water and/or bird nesting. Most of the windows need replacement.
- On the interior most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced.
- Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget). In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.
- No major structural concerns were observed.
- Although some of the roof framing of the school is similar (utilizing precast TT sections) to Irrigon JR/SR High School, there are no signs of damage or cracking. A few areas above the ceiling in the original classrooms where the precast TT roof is located were inspected and appeared in great shape.

Front entry

- On each side of the stage opening, there is some minor cracking where the Precast beam spans the opening and attaches to the CMU pilaster each end. This appears to be due to the beam embed being welded to the pilaster embed. As some minor expansion/contraction and movement in the building occurs, this will produce these small cracks since the welding does not allow one end of the beam to slip.
- The roof access ladder from the main roof to the mid-roof is broken at the attachment to the wall and the anchors are loose or pulling out
- The boilers appear to have been installed in 1996 and appear to have reached near end of their operable life.

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
Sam Boardman Elementary	1980 w/ additions in 1991, 2017	53,125	$45,245,941 ($852/SF)	$17,387,434	**38.4%**

- There is one air cooled chiller installed in 1996 that provides chilled water for the building and is at the end of operable life.
- Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation.
- The ceiling mounted fan coils in the classrooms should be replaced with a similar style unit as they are at the end of their operable life. The new fan coils should be design with low noise emittance and include the ability to provide fresh ventilation to the classrooms with high air filtration to promote high indoor air quality.
- The existing VRF and Gym air handling unit can remain as they are in newer condition.
- The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.
- There is no fire protection system within the building.
- It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. There appear to be some damaged piping that has been repaired over the years. There are several domestic hot water heaters within the building mostly located in janitor rooms. Some existing domestic hot water heaters have been replaced.
- Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.
- The existing main electrical distribution equipment is a GE type AV- Line fused switchboard and is original to the building nearing the end of its usable life at 45 years old. The main distribution equipment is located within a mechanical platform space with adequate physical space for expansion. Distribution boards, step down transformers and branch panelboards appear to be of the same age as the main distribution equipment except for those which have been added to support additions and renovations. The electrical distribution equipment serving corridors, classrooms and support spaces throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits. Panelboards primarily serving mechanical equipment appeared to have physical capacity for additional circuits.
- The existing receptacle quantities and locations throughout the building, specifically in classrooms, varied by location. Some of the observed classrooms had receptacles retrofitted in and appeared to be adequate for program needs. Some observed classrooms had minimal receptacles and were inadequate for program needs.
- Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. It was noted by facility personnel that a failed lighting ballast was the cause of a past fire within the building.
- Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Bug-eye type fixtures provide emergency lighting throughout the building; based on the observed spacing, it is questionable whether the current spacing meets code minimum illumination requirements.
- Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.
- The existing Simplex 4010 horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements. However, the existing Simplex 4010 fire alarm control panel is a discontinued product line, and it is recommended that it be upgraded to a modern panel. It is likely that the existing notification/detection devices could remain and integrate with the new head-end and would not require a wholesale replacement. Additionally, modern building code would require a fire alarm system utilizing voice evacuation for an occupancy of

this type; however, since the current horn/strobe system met code at the time of installation, it is grandfathered in. Typically, an upgrade to voice evacuation would only be required under significant renovations. An elective upgrade would be to replace the fire alarm system with a new voice evacuation system to meet current code and enhance building safety.
- The main distribution frame and intermediate distribution frames were observed during the facility tour which consisted of (2) two post racks and multiple wall mount racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.
- The existing data outlet quantities and locations throughout the building, specifically in classrooms, varied by location. Some of the observed classrooms had adequate data infrastructure to support wireless access points, IP phones and other space needs. Other classrooms had minimal infrastructure and appeared to be inadequate to support space needs. Structured cabling observed consisted of a mix of Category 5e and 6 grade. In general, structured cabling did not appear to be supported and/or protected properly.
- The existing paging system was not tested during the tour; however, the existing head-end is aged and it was noted by facility personnel that there are lapses in coverage throughout the building. No building centralized clock system was observed.
- A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.
- No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- There is an existing ADT intrusion detection system. The extent of this system coverage was not identified during the tour.

Windy River Elementary School

10-year average enrollment: 272
Staff members (approximate): 37

- In general, this facility is in good condition. Overall, the school is well maintained, however minor wear and tear is reflected in both the exterior and interior.
- At this site there is a lack of security fencing.
- On the exterior the soffits and fascias have damage from either water and/or bird nesting.
- On the interior there is no secure vestibule or secure campus.
- No major structural concerns were observed.
- On the South side of the gymnasium at the restroom walls, there was some cracking occurring in the CMU walls that appears to be due to settlement. It was noticed at the exterior of the building that roof downspouts discharge at the base of the walls and does not pipe away from the building. In addition, the grading of the landscape generally slopes toward the building. Prolonged infiltration of water next to building foundations can eventually result in settlement issues.
- At the main East entry and South entry into the gymnasium, the steel beams and joists are showing signs of rust and weathering. If not maintained, over time the rust will continue to degrade and may start to drip down onto the CMU block and be unsightly. Over long periods of time the rust may degrade the steel and become a structural concern.
- The boilers appear to be original and installed in 2005 and may still have some years of operable life left with proper maintenance.
- There is one air cooled chiller that provides chilled

Front entry

			ODE FCA Metrics		
Building Name	**Construction Date**	**Square Footage (SF)**	**Replacement Budget per FCA (2027)**	**Physical Condition Budget Total (2027)**	**Facility Condition Index (FCI)**
Windy River Elementary	2003 w/ additions in 2006, 2018	44,130	$37,585,005 ($852/SF)	$4,536,370	**12.1%**

water for the building. The chiller, which appears to be original to the building, is located on grade and is nearing the end of its operable life.
- Hot and chilled-water distribution piping appears to be in decent condition with the exception that the existing Victaulic fittings leak when the hot water system is turned off during the summer.
- The classrooms are heated and cooled centralized air handling units located in equipment mezzanines.
- The gymnasium has a single zone air handler with heating water coil only, no cooling.
- The existing air handling units, ductwork, and VAV boxes appear to be in good working order.
- It appears that an existing DDC control system has been installed within the building but may not be working well.
- There is fire sprinkler piping installed within the building and appears to be in good working order and up to current code.
- Plumbing piping appears to be in good condition. Some floor sinks in the kitchen are installed in locations that make it very difficult to maintain.
- The existing main distribution equipment is in good condition with plenty of usable life remaining at approximately 22 years old. The existing branch panelboards are of similar manufacturer and age as the main distribution equipment. Both the main distribution equipment and branch panelboards appeared to have physical capacity to accommodate future circuits.
- There is an existing 20kW natural gas generator at the facility which appears to be in good condition.
- The existing receptacle quantities and locations throughout the building appeared to be adequate in supporting the current space needs.
- Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in good condition.
- Exterior parking lot and building mount site lighting appeared to be adequate, in good condition and likely provides adequate illumination.
- Emergency lighting is achieved via integral emergency battery backup; Based on the observed spacing, the current layouts seem to meet code minimum emergency illumination requirements.
- Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.
- The existing horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements.
- The main distribution frame was observed during the facility tour which consisted of (2) two post racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.
- The existing data outlet quantities and locations throughout the building appeared to be adequate in supporting the current space needs.
- The existing paging system was not tested during the tour; however, no deficiencies were noted by the facility personnel. The system is assumed to be in good working order. The existing clock system appeared to be functional and in good working order.
- A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appears to be in good working condition.
- No centralized access control system was observed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.
- No intrusion detection system was observed.

BBT ARCHITECTS

AC Houghton Elementary School
Architectural Observations

In general, this facility is at the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.

Site:

Parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.

Exterior:

Main Building: Siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.

Interior:

Most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced.

Note: Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget). In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.

BBT ARCHITECTS

Heppner Elementary School
Architectural Observations

In general, the original facility is nearing the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior. The newer Gym facility is in fair condition and has been well maintained.

Site:

Parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing. City Street separates the original building and the gym building which adds to the security concerns.

Exterior:

Main Building: Siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.

Gym Building: Soffits and fascia's have damage from bird nesting.

Interior:

Main Building: Most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced.

Gym Building: In general, good condition with minor upgrades and repairs needed.

Note: Any significant upgrade to original building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget)
In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.

BBT ARCHITECTS

Heppner Junior/Senior High School
Architectural Observations

In general, this facility is nearing the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.

Site:

Parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.

Exterior:

Main Building: Siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.

CTE Building: Siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.

Interior:

Main Building: Most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced.

CTE Building: Entire building lacks ADA upgrades (including access from main building); Fire code/exiting concerns especially in the larger labs; non-working dust collection system and general safety concerns in both labs;

Note: Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget)
In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.

BBT ARCHITECTS

Irrigon Elementary School
Architectural Observations

In general, this facility is in good condition. Overall, the school is well maintained, however minor wear and tear is reflected exterior and interior.

Site:

Lack of security fencing.

Exterior:

Main Building: Soffits and fascia's have damage from either water and/or bird nesting.

Modular: in good condition

Interior:

No secure vestibule or secure campus.

BBT ARCHITECTS

Irrigon Junior/Senior High School
Architectural Observations

In general, this facility is at the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.

Site:

Parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.

Exterior:

Main Building: Lacks Windows; siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.

Annex: Lacks Windows; siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.

Interior:

Most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced.

Note: Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget)
In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.

BBT ARCHITECTS

Riverside Junior/Senior High School
Architectural Observations

In general, this facility is nearing the end of its life cycle. It has had a few remodels and additions, but little upgrades have been completed to meet current codes and security concerns. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.

Site:

Parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.

Exterior:

Main Building: Siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting. Roof has drainage concerns and kalwall skylights in commons appear to be failing.

CTE Building: Siding needs repair and repaint; soffits and fascia's have damage from either water and/or bird nesting.

Wrestling Barn: Newer metal building in fair/good shape.

Interior:

Main Building: Most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced. In the Science area there are major concerns around fire code/exiting out of internal classrooms.

CTE Building: Entire building lacks ADA upgrades (including access from main building); Fire code/exiting concerns especially in the larger labs; non-working dust collection system and general safety concerns in both labs;

Wrestling Barn: In good condition; minor repairs may be needed.

Note: Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget)
In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.

BBT ARCHITECTS

Sam Boardman Elementary School
Architectural Observations

In general, this facility is nearing the end of its life cycle. It has had a few remodels and additions, and some upgrades have been completed to update finishes and update general cosmetic conditions. Overall, the school is well maintained, however general wear and tear is reflected exterior and interior.

Site:

Parking, driveways, sidewalks, and curbs need repairs, repaving and restriping. Limited ADA access. Lack of security fencing.

Exterior:

Main Building: Masonry is in generally good condition; soffits and fascia's have damage from either water and/or bird nesting. Most of the windows need replacement.

Interior:

Most of the flooring and rubber base needs replaced; Most of the acoustical ceiling tile needs replaced; Most doors, door hardware and thresholds do not meet ADA; No secure vestibule or secure campus; Many ADA issues especially around the toilets; most cabinets need to be replaced.

Note: Any significant upgrade to building will trigger energy code upgrades (building envelope insulation) and ADA upgrades (up to 25% of construction budget). In addition, asbestos abatement may be required with any remodel or upgrade to portions of the facility.

BBT ARCHITECTS

Windy River Elementary School
Architectural Observations

In general, this facility is in good condition. Overall, the school is well maintained, however minor wear and tear is reflected exterior and interior.

Site:

Lack of security fencing.

Exterior:

Main Building: Soffits and fascia's have damage from either water and/or bird nesting.

Interior:

No secure vestibule or secure campus.

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: March 13, 2024

School: A.C. Houghton Elementary School – 1105 N Main Ave NE, Irrigon, OR 97844

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of A.C. Houghton Elementary School on March 7, 2024 along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is good. No major structural concerns were observed.
2) At the South side main entrance, there is a raised planter bed up against the exterior wall. The bed is partially up against stucco in some locations and brick veneer at others. There was no signs of water seeping through to the inside of the wall, however whenever soil is retained there is a chance this may occur depending on any water proofing the wall may have applied. Due to the presence of efflorescence (white discoloration) on the veneer, it has been getting sprayed by the planter bed sprinklers for some time. With a planter bed free draining to the soil below this may result in prolonged infiltration of water next to building foundations and can eventually result in settlement issues. (See attached photos)

Recommendations

1) It is recommended to ensure at the planter beds that the proper water proofing is applied to the exterior wall to not allow water infiltration into the building and/or degradation of the exterior finishes due to prolonged soil contact. Drip irrigation is recommended to reduce the amount of water infiltrating below the bed against the foundation. Weep holes in the planter brick face is also recommended to allow excess water to drain out the front of the planter. A landscape engineer should be consulted to provide any additional insight on the proper techniques of planter beds against structures.
2) A general maintenance recommendation is to ensure all landscaping sprinklers are adjusted accordingly to not spray the exterior of the building during watering.

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Sincerely,

Craig Davis, P.E., LEED Green Associate
Principal

(Above: Planter bed next to building)

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: April 1, 2024

School: Heppner Elementary School – 235 Stansbury Street, Heppner, OR 97818

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of Heppner Elementary School on February 9, 2024 along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is good. No major structural concerns were observed.
2) Multiple large pipes extend down the hallway with no diagonal seismic bracing. (see attached photos)
3) A downspout adjacent to the main entry on the Southwest side of the structure discharges into the planter area and is not properly piped away from the structure with storm drainage. Prolonged infiltration of water next to building foundations can eventually result in settlement issues. (See attached photo)
4) A larger crack exists above the door to the Boiler Room in the downstairs hallway. (See attached photo)
5) Mortar has deteriorated in the brick on the West face of the building below the large glassblock area. (See attached photo)
6) Minor cracking exists in the sheetrock at both levels but do not appear to be settlement cracks. In general, gapping around doors appears consistent.

Recommendations

1) Install diagonal Unistrut bracing at each trapeze to prevent excessive lateral movement and potential fracture in a seismic event.
2) It is recommended that all roof downspouts be piped away from the structure and discharged in such a way to naturally drain away from the structure. Re-grading and sloping the grade away from the structure will also help any natural water runoff not from downspouts to drain away from the structure. It is recommended to consult a civil engineer to properly design a drainage system that meets all code requirements for the area.
3) The crack should be repaired and monitored to see if it returns.
4) Where mortar has deteriorated it should be scraped out a minimum of 1 ½" and reinstalled. Would highly recommend a water sealant be placed after completion to avoid future deterioration.
5) Monitor all wall cracks and door thresholds, if cracks grow diagonally and doors need adjustment an engineer should be consulted to further assess the problem.

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Sincerely,

Jon L. Walker, P.E., S.E.
Principal

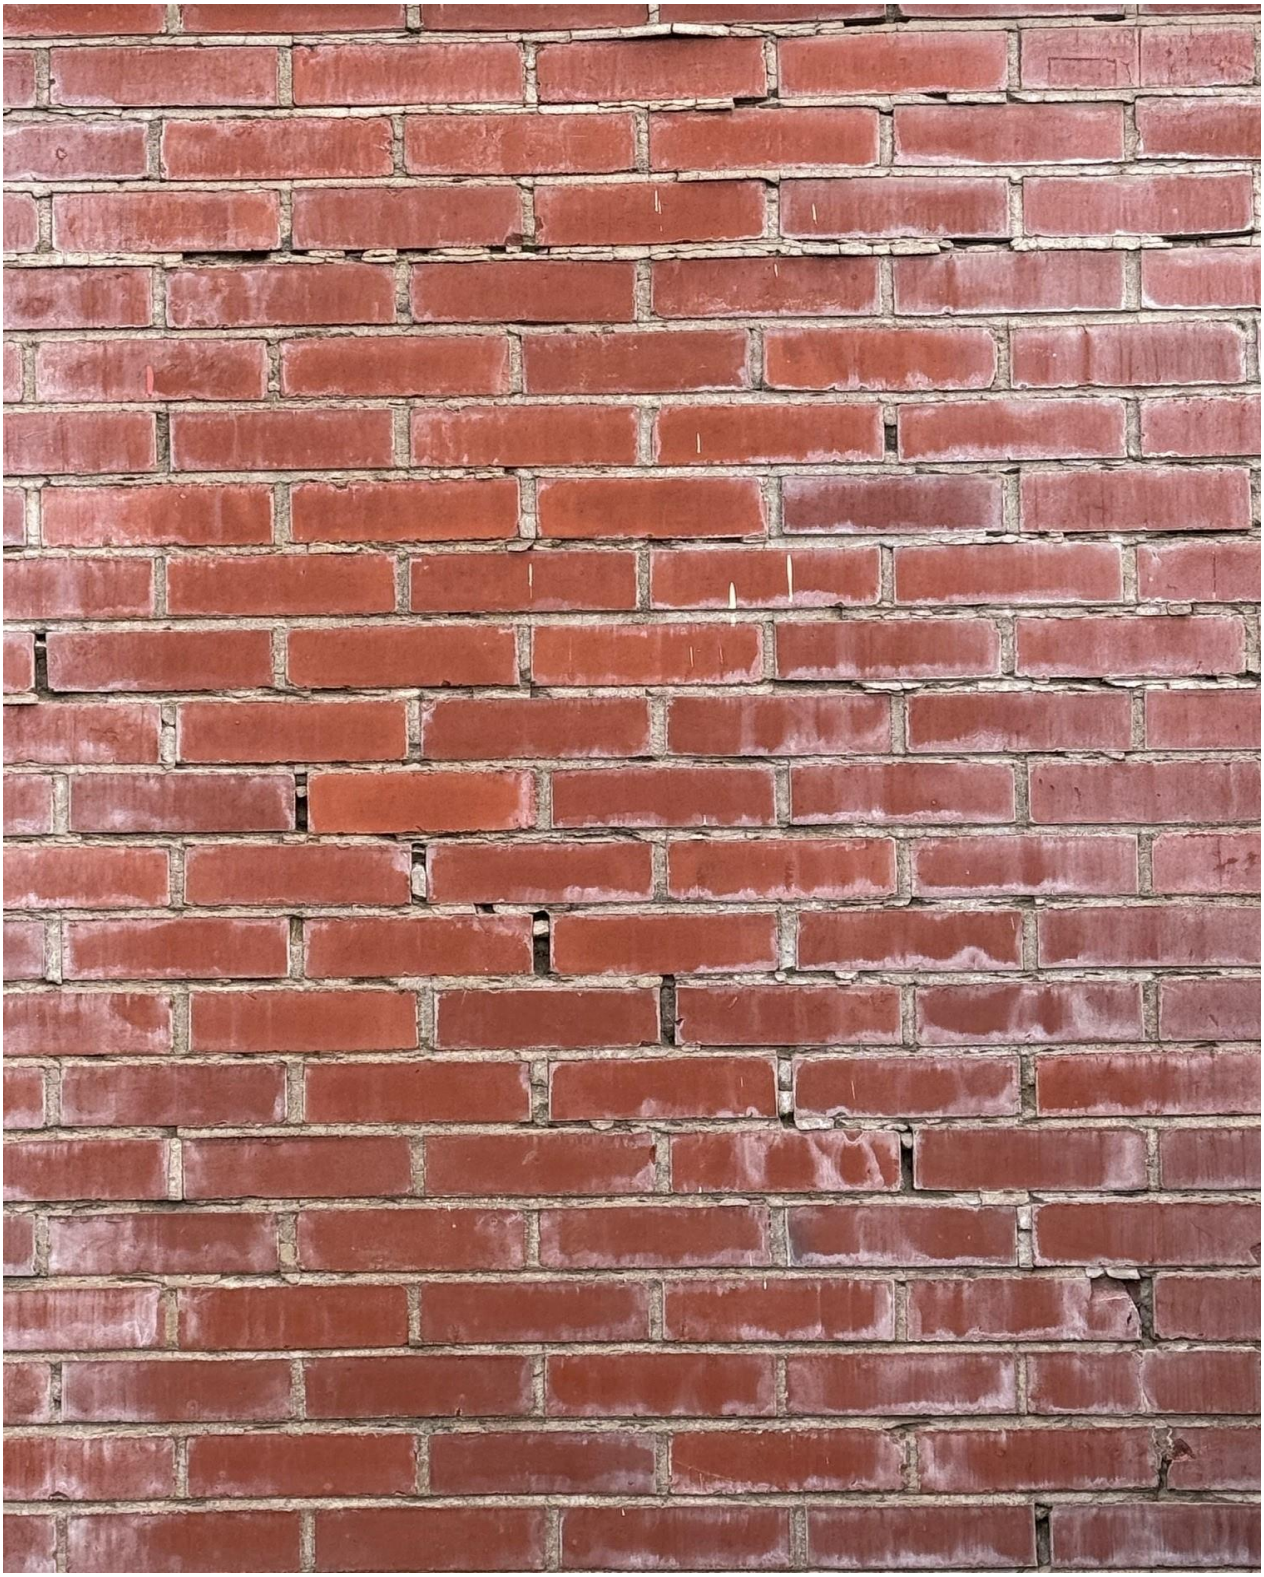
(Above: improper roof drainage at entrance Below: Boiler Room wall crack)



(Above: mortar damage at existing brick wall on West side)

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: April 2, 2024

School: Heppner JR-SR High School – 710 Morgan Street, Heppner, OR 97836

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of Heppner JR-SR High School on February 9, 2024, along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is good. However, a few structural concerns are noted below.
2) Several concrete pilasters in large crawl space have damage at the corners and rusted reinforcing. (see attached photo) Additionally, storm drainage is currently flowing through this crawl space and adjacent to these pilasters and footings below.
3) Glulam floor beams for classrooms above were installed upside down with “Top” being visible from the bottom of the beam.
4) Significant damage has occurred where the guard rail at the exterior ramp attached to the concrete wall on the South end of the Gymnasium. (See attached photo)
5) There are signs of roof leaks in the small wrestling room & band room (stained ceiling tiles).
6) Upstairs classrooms and hallways look good with minimal cracks in sheet rock and proper gapping at doors.
7) Shop building structure appears in good condition with limited cracking in the exterior CMU and Concrete walls.
8) Upper mezzanine framing at the Gymnasium where current weight room exists is unknown as the ceiling is sheathed with OSB and existing drawings are unavailable. (See attached photo) Problems have occurred at other High Schools with weight rooms on the second level due to impact loading from heavy barbells for power lifting being dropped.

Recommendations

1) Installation of a proper storm drainage system at the building’s perimeter per a Civil Engineer should be installed to prevent further erosion and potential settlement of footings in the crawl space. Damaged concrete pilasters should be monitored and if deterioration continues, we would recommend replacement.
2) Beams installed upside down are adequate in bending/shear and appear to be sized based on deflection.

3) We recommend removing railing at wall interface so new, larger plates can be installed that anchor into solid concrete. Would recommend the new anchorage is installed a minimum of 3" beyond the edge of the damaged concrete for proper load development.
4) If roof is still leaking above the wrestling room & band room we recommend repair to prevent further damage to structural members.
5) We recommend exposing an area of the existing mezzanine framing below the squat racks to assess the integrity of the existing framing system as this would be the most likely place for damage.

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Sincerely,

Jon L. Walker, P.E., S.E.
Principal

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: March 13, 2024

School: Irrigon Elementary School – 490 SE Wyoming Ave, Irrigon, OR 97844

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of Irrigon Elementary School on March 7, 2024 along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is great. No major structural concerns were observed.
2) On the East side of the gymnasium at the restroom walls, there was some cracking occurring in the CMU walls that appears to be due to settlement. Upon further review of the exterior of the building, it was noticed that roof downspouts discharge at the base of the walls and does not pipe away from the building. In addition, the grading of the landscape generally slopes toward the building. This is very noticeable at the East and North walls of the gymnasium. Prolonged infiltration of water next to building foundations can eventually result in settlement issues. (See attached photos)

Recommendations

1) It is recommended that all roof downspouts be piped away from the structure and discharged in such a way to naturally drain away from the structure. Re-grading and sloping the grade away from the structure will also help any natural water runoff not from downspouts to drain away from the structure. It is recommended to consult a civil engineer to properly design a drainage system that meets all code requirements for the area.
2) A general maintenance recommendation is to ensure all landscaping sprinklers are adjusted accordingly to not spray the exterior of the building during watering. This will help alleviate water running down the exterior of the building and ponding at the base of the wall.

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Sincerely,

Craig Davis, P.E., LEED Green Associate
Principal

(Above: Downspout draining next to foundation and grade sloping toward building)

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: March 13, 2024

School: Irrigon Jr/Sr High School – 1105 N Main Ave NE, Irrigon, OR 97844

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of Irrigon Jr/Sr High School on March 7, 2024 along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is fair. The newer Agricultural building and the West side wood framed addition to the main building are in great condition.
2) In portions of the main building problems with the precast concrete walls, beams and double tee roof members were observed. This includes major cracking in support beams, spalling and breakout of parts of the precast walls at tops of wall, and cracks at bearing ends of the double tee roof members. Additional information on the severity of these conditions was outlined in a memorandum prepared by Pillar Consulting Group dated 9/27/2023. In addition to the memorandum, a temporary shoring plan was created by Pillar Consulting and that work took place over winter break 2023. (See attached photos)
3) At the mechanical mezzanine above the locker rooms, there is water damage to the floor sheathing underneath (2) water heaters. This appears to have been leaking some water in the past. It is unknown if the leak in this area is still a problem. (See attached photos)
4) There is a roof top mechanical unit above the gymnasium/mechanical mezzanine that sits on a steel frame supported atop the parapet. This does not appear to be adequately supported and it is generally advised not to support equipment on parapets. In a seismic event, the parapet may not be adequate to support the unit causing it to collapse on the upper or lower sloped roof. (See attached photos)

Recommendations

1) It is recommended that a comprehensive examination of the entire roof framing (to include all supporting walls) be conducted. With the severity of the known damaged areas, it would be prudent to verify if others areas have issues as well. This will require opening the ceilings in all areas and visually inspecting all roof framing. Depending on what is uncovered in the comprehensive review, if a full school wide repair needs to occur it may be very invasive, time consuming and costly.

2) A licensed plumber should be consulted to evaluate the area around the water heaters in the mechanical mezzanine to make sure leaks are no longer a problem. Then we recommend replacing any floor sheathing that may be damaged and from the past leaks.
3) If possible, we recommend moving the roof top unit that sits on the parapet to above the roof and supporting it properly. If the location cannot be moved we recommend seeing about supporting it from the roof by a steel frame and not directly supported by the parapet.
4) A general maintenance recommendation is to ensure all roof drains are clear and free of debris and contain the proper cover. Many drains do not have a cover and the pipe is open and exposed to debris getting into the drain. Other drains just have flat mesh grating as a cover and are prone to debris like leaves clogging them. The risk of clogged drains include rain water ponding on the roof and overstressing the roof framing which could lead to further structural concerns. (See attached photos)

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Sincerely,

Craig Davis, P.E., LEED Green Associate
Principal

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: March 21, 2024

School: Riverside JR./SR. High School – 210 Boardman Ave NE, Boardman, OR 97818

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of Riverside JR./SR. High School on March 8, 2024 along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is good. No major structural concerns were observed.
2) There are multiple areas where roof downspouts discharge at the base of the walls and do not pipe away from the building. In addition, the grading of the landscape generally slopes toward the building at these areas. Prolonged infiltration of water next to building foundations can eventually result in settlement issues. (See attached photos)
3) Outside the North side of the gym doors, there is a wall spicket that is dripping and has been dripping for quite some time. This is up against the foundation and part of the adjacent short retaining wall. Prolonged infiltration of water next to building foundations can eventually result in settlement issues. (See attached photos)
4) There are multiple lath and plaster type walls in the Boys and Girls locker rooms that are deteriorating due to moisture around the shower areas. These walls are non-structural, however they are still a concern as they are separation walls in the locker rooms.

Recommendations

1) It is recommended that all roof downspouts be piped away from the structure and discharged in such a way to naturally drain away from the structure. Re-grading and sloping the grade away from the structure will also help any natural water runoff not from downspouts to drain away from the structure. It is recommended to consult a civil engineer to properly design a drainage system that meets all code requirements for the area.
2) The spicket outside the North gym doors should be replaced so it no longer drips and continually soaks the foundation area. Recommended to consult a licensed plumber to replace.
3) A general maintenance recommendation is to ensure all landscaping sprinklers are adjusted accordingly to not spray the exterior of the building during watering. This will help alleviate water running down the exterior of the building and ponding at the base of the wall.

4) Recommended to replace the walls in the locker room with walls other than a lath and plaster type. With the moisture and heavy use the walls see in a locker room, this will be beneficial. We recommend consulting an Architect for the proper specification of these walls so they comply with all applicable code requirements.

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Sincerely,

Craig Davis, P.E., LEED Green Associate
Principal

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: March 21, 2024

School: Sam Boardman Elementary School – 301 Wilson Rd SW, Boardman, OR 97818

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of Sam Boardman Elementary School on March 8, 2024 along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is great. No major structural concerns were observed.
2) Although some of the roof framing of the school is similar (utilizing precast TT sections) to Irrigon JR/SR High School, there are no signs of damage or cracking. A few areas above the ceiling in the original classrooms where the precast TT roof is located were inspected and appeared in great shape.
3) On each side of the stage opening, there is some minor cracking where the Precast beam spans the opening and attaches to the CMU pilaster each end. This appears to be due to the beam embed being welded to the pilaster embed. As some minor expansion/contraction and movement in the building occurs, this will produce these small cracks since the welding does not allow one end of the beam to slip. (See attached photos)
4) The roof access ladder from the main roof to the mid-roof is broken at the attachment to the wall and the anchors are loose or pulling out.

Recommendations

1) It is recommended that the roof access ladder be replaced with a new ladder and anchored properly to the wall. We recommend a structural engineer be consulted to provide the proper anchors for the ladder.
2) A general maintenance recommendation is to ensure all roof drains are clear of debris and free draining. There were multiple areas that had overgrown grass and other debris around the drains and roof edges. (See attached photos)

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Sincerely,

Craig Davis, P.E., LEED Green Associate
Principal

WALKER
STRUCTURAL ENGINEERING P.C.

STRUCTURAL FIELD OBSERVATION

Date: March 21, 2024

School: Windy River Elementary School – 500 Tatone St. SW, Boardman, OR 97818

Scope Overview

The Morrow County School District is in the process of updating facility assessment reports for schools within the district and part of that process is providing a general overall structural assessment of the buildings. Walker Structural Engineering performed a walk-thru of Windy River Elementary School on March 8, 2024 along with other consultants and representatives from the school district and Wenaha Group. Our observations and recommendations are noted below.

Observations

1) In general, the overall condition of the school is great. No major structural concerns were observed.
2) On the South side of the gymnasium at the restroom walls, there was some cracking occurring in the CMU walls that appears to be due to settlement. Upon further review of the exterior of the building, it was noticed that roof downspouts discharge at the base of the walls and does not pipe away from the building. In addition, the grading of the landscape generally slopes toward the building. Prolonged infiltration of water next to building foundations can eventually result in settlement issues. (See attached photos)
3) At the main East entry and South entry into the gymnasium, the steel beams and joists are showing signs of rust and weathering. If not maintained, over time the rust will continue to degrade and may start to drip down onto the CMU block and be unsightly. Over long periods of time the rust may degrade the steel and become a structural concern. (See attached photos)

Recommendations

1) It is recommended that all roof downspouts be piped away from the structure and discharged in such a way to naturally drain away from the structure. Re-grading and sloping the grade away from the structure will also help any natural water runoff not from downspouts to drain away from the structure. It is recommended to consult a civil engineer to properly design a drainage system that meets all code requirements for the area.
2) A general maintenance recommendation is to ensure all landscaping sprinklers are adjusted accordingly to not spray the exterior of the building during watering. This will help alleviate water running down the exterior of the building and ponding at the base of the wall.
3) It is recommended that all the exposed steel at the main entry and gymnasium entry be properly cleaned of rust, primed, and then painted to protect the steel from the elements. This should be inspected and maintained on a schedule.

Observations contained in this report are based on a broad visual observation only. Concealed problems with the construction of the structure or general structural deficiencies may exist and cannot be revealed through our visible observation. Walker Structural Engineering P.C. can in no way warrant or guarantee the condition of the existing construction of the structure.

Please feel free to contact our office if you have any questions.

Morrow County SD

Facility Assessments

Riverside JR/SR High, Windy River Elementary & Sam Boardman Elementary

Prepared by:

Morrison-Maierle

3/22/2024

Bend Office
1001 SW Disk Drive
Suite #110
Bend, OR 97702

Table of Contents

PROJECT DESCRIPTION

The Morrow County School District facility assessments consisted of site visits to Riverside Jr/Sr High, Windy River Elementary and Sam Boardman Elementary located in Boardman, OR. The purpose of these assessments was to inspect and gather information on the condition of existing mechanical, electrical, plumbing and information and communications technology within each building. The information gathered was used to update the facility assessment spreadsheets to assist in bond efforts.

This narrative provides a high-level overview of the condition of major MEPICT systems at each facility based on visual inspection and existing documentation. Recommendations for improvement, based on industry standard design practices, have been provided for consideration.

RIVERSIDE JR/SR HIGH SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. It appears some boilers have been replaced while others are either original to the building or long past their usable life. There are two air cooled chillers that provide chilled water for the building. The first chiller, which appears to be original to the building is located on grade and is at the end of operable life. The second chiller is also located on grade, adjacent to the newest addition. This chiller appears to be in newer condition and still may have additional years of operational life. Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation and has been repair or replaced in recent years.

Recommendations

Boilers should be maintained annually and kept in good working order. Older boilers should be replaced if they are past their serviceable life. The older ground mounted air-cooled chiller should be replaced with new air-cooled chiller. Piping insulation should be replaced where damaged. Sections of hot and chilled water piping that have been leaking should be replaced with new.

Individual Air Handling Equipment

Observations

The classrooms are served by large centralized air handling equipment ducted to each classroom. The air handling equipment utilized a hot and cold deck type system that allows each classroom to receive either hot or cool air depending on the mode of the classroom. The hot or cool air is controlled with a damper from a thermostat in the room. A cooling coil and heating

coil of each AHU provides the heating and cooling capacity for the dual deck air handling system. Large, centralized exhaust fans relieve air for the classrooms ventilation. Some of the air handling units appear to be newer and in good working order. Wrestling barn is served by a single zone ground mounted air handling unit with exterior ductwork. Welding shop appears to have a new exhaust system installed. Wood shop has an existing exhaust system but the duct collection system appears to be old and not up to current codes. The cafeteria and offices in the central portion of the school have a new air handling unit and VRF system.

Recommendations

Replace existing volume dampers with variable air volume damper in hot deck/cold deck systems to allow for better modulation and control of spaces. Maintain existing air handling units and coils to prevent downtime. Replace existing classroom grilles, registers and diffusers for better airflow and sound. Add classroom carbon dioxide (CO2) sensors that modulate outside air ventilation to the space. Replace older air handlers as necessary. Replace existing ground mounted air-handling equipment and exterior duct insulation for wresting barn. Replace existing wood shop dust collection system.

HVAC Controls

Observations

The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.

Recommendations

Upgrade room controllers and HVAC equipment controls and connect to district wide DDC system.

Fire Protection

Observations

There is no fire protection system within the building.

Recommendations

Add fire sprinklers throughout the building.

PLUMBING SYSTEMS

Plumbing Piping

Observations

Plumbing piping appears to be original to the building. It was reported that the existing plumbing piping has many leaks and is in poor condition. There are many existing domestic hot water heaters through the buildings. Some have been replaced and appear new, others are very old and at the end of their serviceable life.

Recommendations

Replace original domestic water and sanitary piping withing building to prevent further leaks and down time. Replace domestic hot water heaters as necessary.

Plumbing Fixtures

Observations

Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.

Recommendations

Replace plumbing fixtures with new, and upgrade fixtures to ADA compatible where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations

The existing electrical distribution equipment is a mix of old and new equipment, upgraded over time on an instance basis and to support new additions. The existing main electrical distribution equipment is a Westinghouse switchboard board and is original to the building at the end of its usable life at 56 years old. Distribution boards, step down transformers and branch panelboards appear to be of the same age as the main distribution equipment. The electrical distribution equipment throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits. A second utility meter and CT cabinet were observed; this equipment appeared to serve a single mechanical unit on the Northeast side of the property.

A third utility meter was observed on site to serve the AG shop building. The distribution equipment serving this building is a GE fused switchboard and appeared to be approaching the end of its usable life. The associated distribution equipment and branch panelboards appeared to be of the same age as the main distribution equipment. The electrical distribution equipment throughout the AG shop building generally appeared to be full, with minimal spare capacity for additional circuits.

The existing receptacle quantities and locations throughout the main building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs. Faculty noted that the branch power devices in the AG shop building were inadequate for current program needs.

Recommendations

The existing electrical gear original to the building is recommended to be replaced and upgraded in size to support current and future building loads. It is recommended that the two electrical services at the main building be consolidated into one, and the single service be provided with spare capacity to accommodate future electrical loads. This would generally entail

a new service entrance, new main distribution gear and a 1 for 1 replacement and increased capacity of branch panelboards on a case-by-case basis throughout.

The existing electrical gear at the AG shop is recommended to be replaced and upgraded in size to support current and future building loads. This would generally entail a new service entrance, new main distribution gear and a 1 for 1 replacement and increased capacity of branch panelboards on a case-by-case basis throughout.

Additional receptacles should be installed throughout the main building, specifically in classrooms, office and other support spaces to meet modern power needs. Additional receptacles and other specialized equipment connections should be installed throughout the AG shop to meet current and future program needs.

Lighting

Observations

Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. Several instances of yellowing fixtures were observed, due to degradation over time. Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Bug-eye type fixtures provide emergency lighting throughout the building; based on the observed spacing, it is questionable whether the current spacing meets code minimum illumination requirements. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.

Recommendations

Replace the existing lighting throughout the building interior and exterior with new LED lights to increase building efficiency. Add lighting poles and building mount lights with LED light source to increase site illumination. Evaluate the existing emergency lighting coverage throughout the building and add fixtures where lighting is inadequate. Replace the existing lighting controls with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations

The existing Unimode 9600UDLS horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements in the spaces toured.

Recommendations

Modern building code would require a fire alarm system utilizing voice evacuation for an occupancy of this type; however, since the current horn/strobe system met code at the time of installation, it is grandfathered in. Typically, an upgrade to voice evacuation would only be

required under significant renovations. An elective upgrade would be to replace the fire alarm system with a new voice evacuation system to meet current code and enhance building safety. Besides this, no recommendations for improvement.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations

Multiple network distribution frames were observed during the facility tour. These consisted of a mix of two post and wall mounted racks to support structured cabling and network hardware. In general, these appeared to be in good working condition and had some physical capacity for expansion. One wall mounted network rack observed was located within a mechanical space and exposed to poor environmental conditions.

Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building. Structured cabling observed consisted of a mix of Category 5e and 6 grade. In general, structured cabling did not appear to be supported and/or protected properly.

Recommendations

Evaluate the locations of existing network equipment and relocate to suitable environments to maintain functionality and longevity of equipment.

Add (1)-(2) data outlets in classrooms to support current and future classroom technology needs. Add network racks and associated hardware to support the new infrastructure.

Communications

Observations

The existing paging system was not tested during the tour; however, the facility personnel noted that the head-end is in good working order. Minor deficiencies such as general speaker maintenance and lapse of coverage in select locations were noted. The existing American Time & Signal clocks observed were in good working condition.

Recommendations

Identify and repair/replace non-operational paging speakers and clocks on an instance basis. Add speakers where there are lapses in coverage.

Security

Observations

A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.

No centralized access control system was observed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

No intrusion detection system was observed.

Recommendations

Add additional video surveillance cameras at select locations and areas of concern.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance.

Install a small-scale intrusion detection system integrated with the access control system to cover main entrance/exit areas and other select spaces.

WINDY RIVER ELEMENTARY SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of a single boiler and an air-cooled chiller. The boilers appear to be original and installed in 2005 and may still have some years of operable life left with proper maintenance. There is one air cooled chillers that provides chilled water for the building. The chiller, which appears to be original to the building is located on grade and is nearing the end of its operable life. Hot and chilled-water distribution piping appears to be in decent condition with the exception that the existing Victaulic fittings leak when the hot water system is turned off during the summer.

Recommendations

Boilers should be maintained annually and kept in good working order. An additional boiler may be considered to be added to provide redundancy in the event the existing boiler is not functional. Ground mounted air-cooled chiller should be replaced with new air-cooled chiller. Heating water and chilled water piping should be replaced to prevent leaking and degradation of system. Piping insulation should be replaced where damaged sections of hot and chilled water piping that have been leaking should be replaced with new.

Individual Air Handling Equipment

Observations

The classrooms are heated and cooled centralized air handling units located in equipment mezzanines. The air handling units have hot and chilled water coils to provide heating and cooling for the spaces. Ventilation air is directly connected to the air handling units and ducted to exterior louvers in penthouse tiers on the roof. Conditioned supply air is ducted to Variable air volume (VAV) boxes that vary the airflow to each zone. A hot water coil is also located within the VAV box to add additional heating as necessary. The VAV box is controlled by a wall mounted thermostat. The gymnasium has a single zone air handler with heating water coil only, no cooling. The existing air handling units, ductwork, and VAV boxes appear to be in good working order.

Recommendations

Maintain existing air handling units, ductwork and VAV boxes keep equipment in good working order. Add cooling coil to gymnasium air handling equipment to allow for cooling of the gym space.

HVAC Controls

Observations

It appears that an existing DDC control system has been installed within the building but may not be working well.

Recommendations
Upgrade DDC system for compatibility with district wide DD system. .

Fire Protection

Observations
There is fire sprinkler piping installed within the building and appears to be in good working order and up to current code..

Recommendations
Existing fire sprinkler to remain. Maintain system as necessary.

PLUMBING SYSTEMS

Plumbing Piping

Observations
Plumbing piping appears to be in good condition. Some floor sinks in the kitchen are installed in locations that make it very difficult to maintain.

Recommendations
Maintain existing piping as necessary. Relocate floor drains in kitchen to allow for easier access for maintenance.

Plumbing Fixtures

Observations
Plumbing fixtures appear to be in good working order. Existing showers do not appear to be used and non-operable. Some ADA fixtures installed.

Recommendations
Replace any dilapidated plumbing fixtures and upgrade fixtures to ADA where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations
The existing main distribution equipment is in good condition with plenty of useable life remaining at approximately 22 years old. The existing branch panelboards are of similar

manufacturer and age as the main distribution equipment. Both the main distribution equipment and branch panelboards appeared to have physical capacity to accommodate future circuits.

There is an existing 20kW natural gas generator at the facility which appears to be in good condition.

The existing receptacle quantities and locations throughout the building appeared to be adequate in supporting the current space needs.

Recommendations
Regular preventative maintenance is recommended to maintain the integrity of the equipment. No other recommendations for improvement.

Lighting

Observations
Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in good condition. Exterior parking lot and building mount site lighting appeared to be adequate, in good condition and likely provides adequate illumination. Emergency lighting is achieved via integral emergency battery backup; Based on the observed spacing, the current layouts seem to meet code minimum emergency illumination requirements. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.

Recommendations
Although the existing interior and exterior lighting is in good working condition, it is still recommended that the existing lighting be upgraded to LED to increase building efficiency. Similarly, it is recommended that the existing lighting controls be replaced with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations
The existing horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements.

Recommendations
Modern building code would require a fire alarm system utilizing voice evacuation for an occupancy of this type; however, since the current horn/strobe system met code at the time of installation, it is grandfathered in. Typically, an upgrade to voice evacuation would only be required under significant renovations. An elective upgrade would be to replace the fire alarm system with a new voice evacuation system to meet current code and enhance building safety. Besides this, no recommendations for improvement.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations

The main distribution frame was observed during the facility tour which consisted of (2) two post racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.

The existing data outlet quantities and locations throughout the building appeared to be adequate in supporting the current space needs.

Recommendations

No recommendations for improvement.

Communications

Observations

The existing paging system was not tested during the tour; however, no deficiencies were noted by the facility personnel. The system is assumed to be in good working order. The existing clock system appeared to be functional and in good working order.

Recommendations

No recommendations for improvement.

Security

Observations

A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.

No centralized access control system was observed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

No intrusion detection system was observed.

Recommendations

Add additional video surveillance cameras at select locations and areas of concern.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance.

Install a small-scale intrusion detection system integrated with the access control system to cover main entrance/exit areas and other select spaces.

SAM BOARDMAN ELEMENTARY SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. The boilers appear to have been installed in 1996 and appear to have reached near end of their operable life. There is one air cooled chiller installed in 1996 that provides chilled water for the building and is at the end of operable life. Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation.

Recommendations

Hot water boilers should be replaced with high efficiency condensing boilers to extend the life of the heating system. The air-cooled chiller should also be replaced with a similar style chiller. Piping should be repaired where leaks and damage has occurred as necessary.

Individual Air Handling Equipment

Observations

The classrooms are heated and cooled with a ceiling mounted fancoil consisting of hot water and chilled water coils, a fan, and a thermostat for control. The air is ducted to ceiling mounted diffusers. When operating, the fancoils have a high noise level within the classroom space. Ventilation air may be provided directly to ceiling mounted fancoils as there is a relief duct in the classroom up to the roof to relieve incoming ventilation air. Some classroom fancoils are installed below the ceiling level. The front office area is served by a new Variable Refrigerant Flow (VRF) system to provide heating and cooling with an energy recovery ventilator (ERV) to provide ventilation. A new large air handling unit serves the gym and connects to existing ductwork . The gym air handling unit utilizes an electric heating coil to heat the space.

Recommendations

The ceiling mounted fancoils in the classrooms should be replaced with a similar style unit as they are at the end of their operable life. The new fancoils should be design with low noise emittance and include the ability to provide fresh ventilation to the classrooms with high air filtration to promote high indoor air quality. The existing VRF and Gym air handling unit can remain as they are in newer condition.

HVAC Controls

Observations

The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.

Recommendations
Upgrade room controllers and HVAC equipment controls and connect to district wide DDC system.

Fire Protection

Observations
There is no fire protection system within the building.

Recommendations
Add fire sprinklers throughout the building.

PLUMBING SYSTEMS

Plumbing Piping

Observations
It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. There appear to be some damaged piping that has been repaired over the years. There are several domestic hot water heaters within the building mostly located in janitor rooms. Some existing domestic hot water heaters have been replaced.

Recommendations
Replace original domestic water piping as necessary to prevent further damage to piping system. Add sectional valves to piping to allow isolation of plumbing fixture groups for easier repair in the future. Scope the existing sanitary drain piping with a camera to determine condition of sanitary system.

Plumbing Fixtures

Observations
Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.

Recommendations
Replace plumbing fixtures with new, and upgrade fixtures to ADA compatible where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations
The existing electrical distribution equipment is a mix of old and new equipment, upgraded over time on an instance basis. The existing main electrical distribution equipment is a GE type AV-

Line fused switchboard and is original to the building nearing the end of its usable life at 45 years old. The main distribution equipment is located within a mechanical platform space with adequate physical space for expansion. Distribution boards, step down transformers and branch panelboards appear to be of the same age as the main distribution equipment except for those which have been added to support additions and renovations. The electrical distribution equipment serving corridors, classrooms and support spaces throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits. Panelboards primarily serving mechanical equipment appeared to have physical capacity for additional circuits.

The existing receptacle quantities and locations throughout the building, specifically in classrooms, varied by location. Some of the observed classrooms had receptacles retrofitted in and appeared to be adequate for program needs. Some observed classrooms had minimal receptacles and were inadequate for program needs.

Recommendations

The existing electrical gear original to the building is recommended to be replaced and upgraded to support current and future building electrical needs. This would generally entail a new service entrance, new main distribution gear and a 1 for 1 replacement and increased capacity of branch panelboards on a case-by-case basis throughout.

Current receptacle infrastructure within spaces should be evaluated on a case-by-case basis and added where inadequate. This likely involves adding receptacles and circuits to most classrooms to suit modern power needs.

Lighting

Observations

Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. It was noted by facility personnel that a failed lighting ballast was the cause of a past fire within the building. Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Bug-eye type fixtures provide emergency lighting throughout the building; based on the observed spacing, it is questionable whether the current spacing meets code minimum illumination requirements. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.

Recommendations

Replace the existing lighting throughout the building interior and exterior with new LED lights to increase building efficiency. Add lighting poles and building mount lights with LED light source to increase site illumination. Evaluate the existing emergency lighting coverage throughout the building and add fixtures where lighting is inadequate. Replace the existing lighting controls with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations
The existing Simplex 4010 horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements.

Recommendations
The existing Simplex 4010 fire alarm control panel is a discontinued product line, and it is recommended that it be upgraded to a modern panel. It is likely that the existing notification/detection devices could remain and integrate with the new head-end and would not require a wholesale replacement. Additionally, modern building code would require a fire alarm system utilizing voice evacuation for an occupancy of this type; however, since the current horn/strobe system met code at the time of installation, it is grandfathered in. Typically, an upgrade to voice evacuation would only be required under significant renovations. An elective upgrade would be to replace the fire alarm system with a new voice evacuation system to meet current code and enhance building safety.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations
The main distribution frame and intermediate distribution frames were observed during the facility tour which consisted of (2) two post racks and multiple wall mount racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.

The existing data outlet quantities and locations throughout the building, specifically in classrooms, varied by location. Some of the observed classrooms had adequate data infrastructure to support wireless access points, IP phones and other space needs. Other classrooms had minimal infrastructure and appeared to be inadequate to support space needs. Structured cabling observed consisted of a mix of Category 5e and 6 grade. In general, structured cabling did not appear to be supported and/or protected properly.

Recommendations
Evaluate data infrastructure within spaces on a case-by-case basis and add infrastructure where inadequate. This likely involves adding (1)-(2) data outlets in classrooms and supporting existing/new cabling properly in conduit with appropriate mounting hardware.

Communications

Observations

The existing paging system was not tested during the tour; however, the existing head-end is aged and it was noted by facility personnel that there are lapses in coverage throughout the building. No building centralized clock system was observed.

Recommendations
Replace the existing paging system with new and increase audible coverage throughout the building. Install a modern centralized wired/wireless clock system.

Security

Observations
A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.

No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

There is an existing ADT intrusion detection system. The extent of this system coverage was not identified during the tour.

Recommendations
Add additional video surveillance cameras at select locations and areas of concern.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance.

Replace the existing intrusion detection system with a new, small-scale intrusion detection system integrated with the access control system to cover main entrance/exit areas and other select spaces.

Morrow County SD

Facility Assessments

Heppner JR/SR High & Heppner Elementary

Prepared by:

Morrison-Maierle

4/26/2024

Bend Office
1001 SW Disk Drive
Suite #110
Bend, OR 97702

Table of Contents

PROJECT DESCRIPTION

The Morrow County School District facility assessments consisted of site visits to Heppner Jr/Sr High and Heppner Elementary located in Heppner, OR. The purpose of these assessments was to inspect and gather information on the condition of existing mechanical, electrical, plumbing and information and communications technology within each building. The information gathered was used to update the facility assessment spreadsheets to assist in bond efforts.

This narrative provides a high-level overview of the condition of major MEPICT systems at each facility based on visual inspection and existing documentation. Recommendations for improvement, based on industry standard design practices, have been provided for

HEPPNER JR/SR HIGH SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. It appears some boilers have been replaced. The boilers utilize propane as a fuel source, and it has been reported that the propane is causing fouling within the boilers. There is a single air cooled chillers that provide chilled water for the building, which appears to be original to the building is located on grade and is at the end of operable life. Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation and has been repair or replaced in recent years.

Recommendations

Boilers should be maintained annually and kept in good working order. Older boilers should be replaced if they are past their serviceable life. Install a propane filtration system to prevent boilers from fouling. The ground mounted air-cooled chiller should be replaced with new air-cooled chiller. Piping insulation should be replaced where damaged. Sections of hot and chilled water piping that have been leaking should be replaced with new.

Individual Air Handling Equipment

Observations

The classrooms are heated and cooled with unit ventilators located along the exterior wall consisting of hot water and chilled water coils, a fan, and a thermostat for control. The air is distributed to the classroom directly from the unit ventilators with no ducting. When operating, the unit ventilators have a high noise level within the classroom space. Ventilation air is provided directly through the unit ventilators as there is a relief duct in the classroom up to the roof to relieve incoming ventilation air. The welding and wood shop are heating with propane unit

heaters and have an older dust collection systems in the woodshop and a new exhaust system for the welding facility. A new large air handling unit serves the gym and connects to existing ductwork .

Recommendations
The classroom unit ventilators should be replaced with a similar style or a ducted fancoil system to allow for better air distribution and lower noise levels. The fancoils or unit ventilators should allow for proper ventilation and filtration of the outdoor air to facilitate better indoor air quality in the classrooms.

HVAC Controls

Observations
The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.

Recommendations
Upgrade room controllers and HVAC equipment controls and connect to district wide DDC system.

Fire Protection

Observations
There is no fire protection system within the building.

Recommendations
Add fire sprinklers throughout the building.

PLUMBING SYSTEMS

Plumbing Piping

Observations
It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. There appear to be some damaged piping that has been repaired over the years. There are several domestic hot water heaters within the building mostly located in janitor rooms. Some existing domestic hot water heaters have been replaced.

Recommendations
Replace original domestic water piping as necessary to prevent further damage to piping system. Add sectional valves to piping to allow isolation of plumbing fixture groups for easier repair in the future. Scope the existing sanitary drain piping with a camera to determine condition of sanitary system.

Plumbing Fixtures

Observations
Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.

Recommendations
Replace plumbing fixtures with new, and upgrade fixtures to ADA compatible where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations
The existing main distribution equipment is a Coast Electric fused switchboard original to the building and at the end of its usable life at 62 years old. This equipment is located within the existing crawlspace exposed to non-ideal environmental conditions. Distribution boards and branch panelboards are generally of the same age, with some newer equipment that has been added over time to support new loads. The electrical distribution throughout the main building appeared to be full, with minimal spare capacity for additional circuits. There are (3) single phase utility step-down transformers that provide 3-phase service to the building.

The existing distribution equipment in the Shop Building is fed from the main building's electrical service. This equipment is a Circle Products fused switchboard, original to the building and nearing the end of its usable life at 48 years old. The Shop Building distribution equipment appeared to be full, with minimal spare capacity for additional circuits.

No existing generator was observed.

The existing receptacle quantities and locations throughout the main building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.

Recommendations
The existing electrical gear original to the building is recommended to be replaced and upgraded in size to support current and future building loads. This would generally entail a new service entrance, new main distribution gear and a 1 for 1 replacement and increased capacity of branch panelboards on a case-by-case basis throughout. The location of the main distribution equipment should be evaluated, and a new space potentially be built out to house the upgraded equipment. The (3) utility transformers on site are likely beyond their usable life and should be removed and replaced with a single 3-phase utility transformer in coordination with the electric utility.

The existing distribution in the Shop Building is recommended to be replaced with new due to age. This would generally entail new distribution gear and a 1 for 1 replacement of branch

panelboards. The existing capacity should be evaluated and, if necessary, increased to support current and future program needs.

Additional receptacles should be installed throughout the main building, specifically in classrooms, office and other support spaces to meet modern power needs. Additional receptacles and other specialized equipment connections should be installed throughout the Shop Building to meet current and future program needs.

Lighting

Observations

Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. Several instances of yellowing fixtures were observed, due to degradation over time. Exterior parking lot and building mount site lighting is minimal, in poor condition and does not provide adequate illumination. The emergency lighting source throughout the building was not observed — no bug-eye, centralized inverter, or light fixtures with indicator lights were observed; it is unknown whether the current emergency lighting configuration throughout the building meets code minimum illumination requirements. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.

Recommendations

Replace the existing lighting throughout the building interior and exterior with new LED lights to increase building efficiency. Add lighting poles and building mount lights with LED light source to increase site illumination. Evaluate the existing emergency lighting source and coverage throughout the building to determine whether it meets modern code; add emergency lighting where needed. Replace the existing lighting controls with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations

The existing Edwards 2400 series fire alarm control panel is at the end of its usable life; facility personnel noted recurring false alarms and maintenance issues. No notification or detection was observed in classrooms. Notification and detection devices were observed in corridors; however, it is possible that the current spacing and layout may not meet modern building code based on the observed locations.

Recommendations

A complete replacement of the existing fire alarm system is recommended to correct deficiencies and meet modern code requirements. This would generally entail a new fire alarm control panel with voice evacuation and new notification/detection devices throughout the building.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations

The main distribution frame and intermediate distribution frames were observed during the facility tour which consisted of (2) two post racks and multiple wall mount racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.

Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building and it was noted that network connectivity is adequate. Structured cabling observed consisted of a mix of Category 5e and 6 grade. In general, structured cabling did not appear to be supported and/or protected properly.

Recommendations

Add (1)-(2) data outlets in classrooms to support current and future classroom technology needs. Add network racks and associated hardware to support the new infrastructure. Support and/or enclose existing structured cabling where feasible.

Communications

Observations

The existing paging system was not tested during the tour; however, the existing head-end is aged and it was noted by facility personnel that there are lapses in coverage and some maintenance issues with speakers throughout the building. The existing clock system is not functional.

Recommendations

Replace the existing paging system with new and increase audible coverage throughout the building. Install a modern centralized wired/wireless clock system.

Security

Observations

The existing video surveillance system is an analog system that is at the end of its usable life.

No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

No intrusion detection system was observed.

Recommendations

A new IP based video surveillance system is scheduled to be installed within the year. No recommendations for improvement.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance.

Install a small-scale intrusion detection system integrated with the access control system to cover main entrance/exit areas and other select spaces.

HEPPNER ELEMENATARY SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. It appears the boilers are well beyond their serviceable life. The boilers utilize fuel oil (diesel) as a fuel source. There is a single air cooled chillers that provide chilled water for the building, which appears to be original to the building is located on grade and is at the end of operable life. Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation and has been repair or replaced in recent years. The gym-café building is heated and cooled with propane rooftop units with packaged DX cooling.

Recommendations

Boilers should be replaced with new high efficiency boilers. Consider utilize a propane system rather than fuel oil. The ground mounted air-cooled chiller should be replaced with new air-cooled chiller. Piping insulation should be replaced where damaged. Sections of hot and chilled water piping that have been leaking should be replaced with new.

Individual Air Handling Equipment

Observations

The classrooms are heated and cooled with unit ventilators located along the exterior wall consisting of hot water and chilled water coils, a fan, and a thermostat for control. The air is distributed to the classroom directly from the unit ventilators with no ducting. When operating, the unit ventilators have a high noise level within the classroom space. Ventilation air is provided directly through the unit ventilators as there is a relief duct in the classroom up to the roof to relieve incoming ventilation air. The gym-café is heating and cooled with packaged rooftop air handling units with propane heat and DX cooling.

Recommendations

The classroom unit ventilators should be replaced with a similar style or a ducted fancoil system to allow for better air distribution and lower noise levels. The fancoils or unit ventilators should allow for proper ventilation and filtration of the outdoor air to facilitate better indoor air quality

in the classrooms. Existing RTU's on the gym-café building should be maintained and components replaced as they age.

HVAC Controls

Observations
The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.

Recommendations
Upgrade room controllers and HVAC equipment controls and connect to district wide DDC system.

Fire Protection

Observations
There is no fire protection system within the building.

Recommendations
Add fire sprinklers throughout the building.

PLUMBING SYSTEMS

Plumbing Piping

Observations
It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. There appear to be some damaged piping that has been repaired over the years. There are several domestic hot water heaters within the building mostly located in janitor rooms. Some existing domestic hot water heaters have been replaced.

Recommendations
Replace original domestic water piping as necessary to prevent further damage to piping system. Add sectional valves to piping to allow isolation of plumbing fixture groups for easier repair in the future. Scope the existing sanitary drain piping with a camera to determine condition of sanitary system.

Plumbing Fixtures

Observations
Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.

Recommendations
Replace plumbing fixtures with new, and upgrade fixtures to ADA compatible where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations

The existing distribution equipment within the main building is of varying age. The main distribution equipment with the incoming electrical service feeder was installed in the 1995 addition and used to back feed the original distribution equipment. The 1995 equipment is a Siemens type S5 distribution board and is in good working condition with plenty of usable life remaining at 27 years old. The associated branch panelboards installed in the 1995 addition appeared to be in good working condition with spare capacity.

The distribution equipment original to the building and back fed from the 1995 equipment is a Square D fused switchboard and at the end of its usable life at 69 years old. The associated branch panelboards fed from this equipment are of the same age and have little to no spare capacity for additional circuits. The facility personnel noted power capacity issues within the original building.

The distribution equipment within the stand-alone gym building consists of Siemens type P1 panelboards and is in good working condition with plenty of usable life remaining at 22 years old. The associated branch panelboards and step-down transformers installed in the gym building appeared to be in good working condition with spare capacity.

The existing receptacle quantities and locations throughout the original building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.

The existing receptacle quantities and locations throughout the 1995 addition and gym building appeared to be adequate for the current program needs.

Recommendations

Regular preventative maintenance is recommended to maintain the integrity of the equipment installed in the 1995 addition and gym building. No other recommendations for improvement associated for that vintage of equipment.

The electrical equipment original to the building is recommended to be replaced with new. This would generally entail a 1 for 1 replacement and increased capacity of the distribution gear and branch panelboards throughout.

Additional receptacles should be installed throughout the original building, specifically in classrooms, office and other support spaces to meet modern power needs. Spaces within the 1995 addition and gym building should be evaluated and additional power added where needed.

Lighting

Observations

Within the original building, lighting generally consisted of fluorescent and HID light source type fixtures in fair to poor condition. Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Minimal emergency lighting was observed; based on the observed spacing, it is questionable whether the current spacing meets code minimum illumination requirements. No automatic lighting controls or dimming was observed in the original building.

Within the 1995 addition and gym building, lighting generally consisted of fluorescent and HID light source type fixtures in good condition. Exterior parking lot lighting South of the gym building utilized metal halide bulbs and appeared to be in good condition. Some automatic lighting controls were observed in the 1995 addition. No dimming was observed.

Recommendations

Replace the existing lighting throughout the original building, 1995 addition and gym building interior and exterior with new LED lights to increase building efficiency. Add lighting poles and building mount lights around the main building exterior to increase site illumination. Evaluate the existing emergency lighting coverage, specifically throughout the original building, and add fixtures where lighting is inadequate. Replace the existing lighting controls throughout with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations

Within the original building, the existing Edwards LSS4 fire alarm control panel is at the end of its usable life. The existing notification/detection devices throughout the original building are of the same age.

The 1995 addition utilizes a Silent Knight zone communicator interfaced with the original building fire alarm control panel. The gym building has a Silent Knight 5808 fire alarm control panel installed and appeared to be in good working condition.

Recommendations

A complete replacement of the existing fire alarm control panel and associated notification/detection devices within the main building is recommended. This would entail a new fire alarm control panel with voice evacuation and new notification/detection devices throughout the building, including the addition for uniformity and in compliance with modern code. It is recommended that the new fire alarm system be interfaced with the existing gym fire alarm system for monitoring.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations

The main distribution frame and intermediate distribution frames were observed during the tour. This included two post and wall mount racks within the original building, 1995 addition and gym building. This equipment was in good condition and had spare physical capacity for expansion.

The existing data outlet quantities and locations throughout the building, specifically in classrooms, varied by location. Spaces within the 1995 addition and gym building appeared to have adequate data infrastructure to support wireless access points, IP phones and other space needs. Spaces within the original building had minimal infrastructure and appeared to be inadequate to support space needs. Structured cabling observed consisted of a mix of Category 5e and 6 grade. Within the original building, structured cabling did not appear to be supported and/or protected properly.

Recommendations

Add (1)-(2) data outlets in original building classrooms to support current and future classroom technology needs. Add network racks and associated hardware to support the new infrastructure. Support and/or enclose existing structured cabling where feasible.

Evaluate data infrastructure within the 1995 addition and gym spaces on a case-by-case basis and add infrastructure where necessary.

Communications

Observations

The existing paging system was not tested during the tour; however, the existing head-end within the original building is aged and it was noted by facility personnel that there are lapses in coverage throughout the building. The clock system is obsolete and non-functional.

Recommendations

Replace the existing paging system with new and increase audible coverage throughout the building. Install a modern centralized wired/wireless clock system. For uniformity and maximum flexibility, it is recommended that the new systems be extended to the 1995 addition and gym building.

Security

Observations

A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.

No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

No intrusion detection system was observed.

Recommendations

Add additional video surveillance cameras at select locations and areas of concern.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance. Extend the access control system to the gym building to enable automatic lock/unlocking of doors during transition periods where students and faculty pass between buildings.

Install a small-scale intrusion detection system integrated with the access control system to cover main entrance/exit areas and other select spaces throughout.

Morrow County SD

Facility Assessments

Irrigon JR/SR High, Irrigon Elementary & A.C. Houghton Elementary

Prepared by:

Morrison-Maierle

3/12/2024

Bend Office
1001 SW Disk Drive
Suite #110
Bend, OR 97702

Table of Contents

PROJECT DESCRIPTION

The Morrow County School District facility assessments consisted of site visits to Irrigon Jr/Sr High, Irrigon Elementary and AC Houghton Elementary located in Irrigon, OR. The purpose of these assessments were to inspect and gather information on the condition of existing mechanical, electrical, plumbing and information and communications technology within each building. The information gathered was used to update the facility assessment spreadsheets to assist in bond efforts.

This narrative provides a high-level overview of the condition of major MEPICT systems at each facility based on visual inspection and existing documentation. Recommendations for improvement, based on industry standard design practices, have been provided for consideration.

IRRIGON JR/SR HIGH SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. The boilers appear to have been replaced in 2002 and still have some years of operable life left with proper maintenance. There are two air cooled chillers that provide chilled water for the building. The first chiller, which appears to be original to the building is located on grade and is at the end of operable life. The second chiller is located on the roof, adjacent to the newest addition. This chiller appears to be in newer condition and still may have additional years of operational life. Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation.

Recommendations

Boilers should be maintained annually and kept in good working order. Ground mounted air-cooled chiller should be replaced with new air-cooled chiller. Piping insulation should be replaced where damaged. Sections of hot and chilled water piping that have been leaking should be replaced with new.

Individual Air Handling Equipment

Observations

The classrooms are heated and cooled with a ceiling mounted fancoil consisting of hot water and chilled water coils, a fan, and a thermostat for control. The air is ducted to ceiling mounted diffusers. When operating, the fancoils have a high noise level within the classroom space. Ventilation air may be provided directly to ceiling mounted fancoils as there is a relief duct in the classroom up to the roof to relieve incoming ventilation air. Some classroom fancoils are installed below the ceiling level. The front office area is served by a new Variable Refrigerant

Flow (VRF) system to provide heating and cooling with an energy recovery ventilator (ERV) to provide ventilation. A new large air handling unit serves the cafeteria and connects to existing ductwork .

Recommendations
The ceiling mounted fancoils in the classrooms should be replaced with a similar style unit as they are at the end of their operable life. The new fancoils should be design with low noise emittance and include the ability to provide fresh ventilation to the classrooms with high air filtration to promote high indoor air quality.

HVAC Controls

Observations
The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.

Recommendations
Upgrade room controllers and HVAC equipment controls and connect to district wide DDC system.

Fire Protection

Observations
There is no fire protection system within the building.

Recommendations
Add fire sprinklers throughout the building.

PLUMBING SYSTEMS

Plumbing Piping

Observations
It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. It was noted that the sanitary piping often struggles to drain and may be damaged in some areas. There are several domestic hot water heaters within the building mostly located in janitor rooms.

Recommendations
Replace original domestic water and sanitary piping withing building to prevent further leaks and down time.

Plumbing Fixtures

Observations

Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.

Recommendations
Replace plumbing fixtures with new, and upgrade fixtures to ADA compatible where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations
The existing electrical distribution equipment is a mix of old and new equipment, upgraded over time on an instance basis and to support new additions. The existing main electrical distribution equipment is a Westinghouse type Pow-R-Line fused switchboard and is original to the building nearing the end of its usable life at 45 years old. The electrical room hosting the distribution gear is suffering from structural damage which impacts overall safety around the equipment. Distribution boards, step down transformers and branch panelboards appear to be of the same age as the main distribution equipment. The electrical distribution equipment throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits.

There is an existing generator at the facility which is assumed to have been installed under the CSEPP program. The generator did not appear to have been maintained or functional.

The existing receptacle quantities and locations throughout the building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.

Recommendations
The existing electrical gear original to the building is recommended to be replaced and upgraded to support current and future building electrical needs. This would generally entail a 1 for 1 replacement of electrical gear and increasing the capacity of branch panelboards throughout.

Additional receptacles should be installed throughout the building, specifically in classrooms, office and other support spaces to meet modern power needs.

Lighting

Observations
Lighting throughout the building generally consisted of fluorescent light source type fixtures in fair to poor condition. Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Bug-eye type fixtures provide emergency lighting throughout the building; based on the observed spacing, it is questionable whether the current spacing meets code minimum illumination requirements. Lighting controls

observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.

Recommendations
Replace the existing lighting throughout the building interior and exterior with new LED lights to increase building efficiency. Add lighting poles and building mount lights to increase site illumination. Evaluate the existing emergency lighting coverage throughout the building and add fixtures where lighting is inadequate. Replace the existing lighting controls with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations
The fire alarm control panel had been upgraded to a modern Simplex 4100ES system; however, it did not appear that the upgrades were extended to notification/detection devices throughout the building. The existing notification/detection devices appeared to be at the end of their usable life. Lapses in detection and notification coverage were observed in some of the toured spaces. The building has experienced nuisance alarms and maintenance challenges with the proprietary fire alarm system.

Recommendations
A complete replacement of the existing fire alarm system is recommended to correct deficiencies and meet modern code requirements.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations
Multiple network distribution frames were observed during the facility tour. These consisted of a mix of two post and wall mounted racks to support structured cabling and network hardware. In general, these appeared to be in good working condition, but had limited physical capacity for expansion.

Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building and it was noted that network connectivity is adequate. Structured cabling observed consisted of a mix of Category 5e and 6 grade.

Recommendations
Add (1)-(2) data outlets in classrooms to support current and future classroom technology needs. Add network racks and associated hardware to support the new infrastructure.

Communications

Observations

The existing paging system was not tested during the tour; however, it was noted by facilities that the existing head-end is operational but is increasingly unreliable and there are lapses in coverage throughout the building. No building centralized clock system is installed.

Recommendations

Replace the existing paging system with new and increase audible coverage throughout the building. Install a modern centralized wired/wireless clock system.

Security

Observations

A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.

No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

There is an existing intrusion detection system which covers the main office and library only. Facility personnel noted false tripping and functionality issues with the existing system.

Recommendations

Add additional video surveillance cameras at select locations and areas of concern.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance.

Replace the existing intrusion detection system with a new, small-scale intrusion detection system to cover main entrance/exit areas and other select spaces.

IRRIGON ELEMENTARY SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of a single boiler and an air-cooled chiller. The boilers appear to be original and installed in 2002 and may still have some years of operable life left with proper maintenance. There is one air cooled chillers that provides chilled water for the building. The first chiller, which appears to be original to the building is located on grade and is nearing the end of its operable life. An additional air cooled DX condensing unit provides cooling to the pressurization systems original to the building, and does not appear to be used or necessary to the current operation of the building. Hot and chilled-water distribution piping appears to be in decent condition with the exception that the existing Victaulic fittings leak when the hot water system is turned off during the summer.

Recommendations

Boilers should be maintained annually and kept in good working order. An additional boiler may be considered to be added to provide redundancy in the event the existing boiler is not functional. Ground mounted air-cooled chiller should be replaced with new air-cooled chiller. Heating water and chilled water piping should be replaced to prevent leaking and degradation of system. Piping insulation should be replaced where damaged sections of hot and chilled water piping that have been leaking should be replaced with new. CSP system should be removed if no longer needed.

Individual Air Handling Equipment

Observations

The classrooms are heated and cooled centralized air handling units located in equipment mezzanines. The air handling units have hot and chilled water coils to provide heating and cooling for the spaces. Ventilation air is directly connected to the air handling units and ducted to exterior louvers in penthouse tiers on the roof. Conditioned supply air is ducted to Variable air volume (VAV) boxes that vary the airflow to each zone. A hot water coil is also located within the VAV box to add additional heating as necessary. The VAV box is controlled by a wall mounted thermostat. The gymnasium has a single zone air handler with heating water coil only, no cooling. The existing air handling units, ductwork, and VAV boxes appear to be in good working order. A single zone, robust air handling unit provides pressurized, filtered, make-up air into the gym for a chemical breach in nearby areas, allowing for a safe place for people to shelter in this event. It appears that this may no longer be required.

Recommendations

Maintain existing air handling units, ductwork and VAV boxes keep equipment in good working order. Add cooling coil to gymnasium air handling equipment to allow for cooling of the gym space.

HVAC Controls

Observations
It appears that an existing DDC control system has been installed within the building but may not be working well.

Recommendations
Upgrade DDC system for compatibility with district wide DD system. .

Fire Protection

Observations
There is fire sprinkler piping installed within the building and appears to be in good working order and up to current code.

Recommendations
Existing fire sprinkler to remain. Maintain system as necessary.

PLUMBING SYSTEMS

Plumbing Piping

Observations
Plumbing piping appears to be in good condition.

Recommendations
Maintain existing piping as necessary.

Plumbing Fixtures

Observations
Plumbing fixtures appear to be in good working order. Existing showers do not appear to be used and non-operable. Some ADA fixtures installed.

Recommendations
Replace any dilapidated plumbing fixtures and upgrade fixtures to ADA where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations

The existing main distribution equipment is a Siemens switchboard and is in good condition with plenty of useable life remaining at approximately 22 years old. The existing branch panelboards are of similar manufacturer and age as the main distribution equipment. Both the main distribution equipment and branch panelboards appeared to have physical capacity to accommodate future circuits.

There is an existing generator at the facility which is assumed to have been installed under the CSEPP program. The generator did not appear to have been maintained or functional.

The existing receptacle quantities and locations throughout the building appeared to be adequate in supporting the current space needs.

Recommendations

Regular preventative maintenance is recommended to maintain the integrity of the equipment. No other recommendations.

Lighting

Observations

Lighting throughout the building generally consisted of fluorescent and HID light source type fixtures in good condition. Exterior parking lot and building mount site lighting appeared to be adequate, in good condition and likely provides adequate illumination. Emergency lighting is achieved via integral emergency battery backup; Based on the observed spacing, the current layouts seemingly meet code minimum emergency illumination requirements. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.

Recommendations

Although the existing interior and exterior lighting is in good working condition, it is still recommended that the existing lighting be upgraded to LED to increase building efficiency. Similarly, it is recommended that the existing lighting controls be replaced with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations

The existing Simplex 4010 horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements.

Recommendations
Modern building code would require a fire alarm system utilizing voice evacuation for an occupancy of this type; however, since the current horn/strobe system met code at the time of installation, it is grandfathered in. Typically, an upgrade to voice evacuation would only be required under significant renovations. An elective upgrade would be to replace the fire alarm system with a new voice evacuation system to meet current code and enhance building safety. Besides this, no recommendations for improvement.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations
The main distribution frame was observed during the facility tour which consisted of (2) two post racks to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.

The existing receptacle quantities and locations throughout the building appeared to be adequate in supporting the current space needs.

Recommendations
No recommendations for improvement.

Communications

Observations
The existing paging system was not tested during the tour; however, no deficiencies were noted by the facility personnel. The system is assumed to be in good working order. The existing clock system appeared to be functional and in good working order.

Recommendations
No recommendations for improvement.

Security

Observations
A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.

No centralized access control system was observed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

No intrusion detection system was observed.

Recommendations

Add additional video surveillance cameras at select locations and areas of concern.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance.

Install a small-scale intrusion detection system to cover main entrance/exit areas and other select spaces.

AC HOUGHTON ELEMENTARY SCHOOL

MECHANICAL SYSTEMS

Central Heating and Cooling Plant

Observations

The existing main heating and cooling equipment is made up of multiple boilers and air-cooled chillers. One boiler appears to have been replaced in recent years and still has some years of operable life left with proper maintenance. There are two air cooled chillers that provide chilled water for the building. The chillers appear to be at the end of their useful life. Hot and chilled-water distribution piping appears to be in decent condition with some damage to insulation.

Recommendations

Boilers should be maintained annually and kept in good working order. Ground mounted air-cooled chillers should be replaced with new air-cooled chiller. Piping insulation should be replaced where damaged. Sections of hot and chilled water piping that have been leaking should be replaced with new.

Individual Air Handling Equipment

Observations

The classrooms are heated and cooled with a wall mounted unit ventilators consisting of hot water and chilled water coils, a fan, and a thermostat for control. The conditioned air is supplied directly to the room. When operating, the unit ventilators have a high noise level within the classroom space. Ventilation air may be provided directly through unit ventilators as there is a relief duct in the classroom up to the roof to relieve incoming ventilation air. The unit ventilators were installed in 2010 and have a 15 year median life. Some classrooms have ceiling mounted fancoils with heating and cooling coils The cafeteria and kitchen had new air handling equipment installed in recent years.

Recommendations

The ceiling mounted fancoils in the classrooms should be replaced with a similar style unit as they are at the end of their operable life. Unit ventilators should be replaced as necessary for maintenance. The new fancoils and unit ventilators should be design with low noise emittance and include the ability to provide fresh ventilation to the classrooms with high air filtration to promote high indoor air quality.

HVAC Controls

Observations

The existing controls in the building appear to be outdated and, in some spaces, not communicating with the central control system.

Recommendations

Upgrade room controllers and HVAC equipment controls and connect to district wide DDC system.

Fire Protection

Observations
There is no fire protection system within the building.

Recommendations
Add fire sprinklers throughout the building.

PLUMBING SYSTEMS

Plumbing Piping

Observations
It was discussed on site that the existing domestic water piping and sanitary piping are original to the building. The existing domestic water piping appears to be galvanized piping and in poor condition. There were discussions of existing sanitary piping crumbling in some areas. There are several newer domestic hot water heaters within the building mostly located in janitor rooms.

Recommendations
Replace original domestic water and sanitary piping within building to prevent further leaks and down time. Replace existing domestic water heaters that are older.

Plumbing Fixtures

Observations
Many of the plumbing fixtures appear to be original to the building or extended past their usable life. It appears most plumbing fixtures do not meet ADA requirements.

Recommendations
Replace plumbing fixtures with new, and upgrade fixtures to ADA compatible where necessary.

ELECTRICAL SYSTEMS

Electrical Service & Distribution

Observations
The existing electrical distribution equipment is a mix of old and new equipment, upgraded over time on an instance basis and to support new additions. The main electrical distribution equipment is a Circle Products fused switchboard and is original to the building at the end of its usable life. Branch panelboards appear to be of the same age as the main distribution

equipment and at the end of its usable life. The electrical distribution equipment throughout the facility generally appeared to be full, with minimal spare capacity for additional circuits.

There is an existing generator at the facility which is assumed to have been installed under the CSEPP program. The generator did not appear to have been maintained or functional.

The existing receptacle quantities and locations throughout the building, specifically in classrooms, were minimal and appeared to be inadequate for the current program needs.

Recommendations

The existing electrical gear original to the building is recommended to be replaced and upgraded to support current and future building electrical needs. This would generally entail a 1 for 1 replacement of electrical gear and increasing the capacity of branch panelboards throughout.

Additional receptacles should be installed throughout the building, specifically in classrooms, office and other support spaces to meet modern power needs.

Lighting

Observations

Lighting throughout the building generally consisted of fluorescent light source type fixtures in fair to poor condition. Exterior parking lot and building mount site lighting is minimal, in fair to poor condition and likely does not provide adequate illumination. Bug-eye and other emergency-only type fixtures provide emergency lighting throughout the building; based on observed spacing, it appears that current spacing may provide code minimum illumination requirements. Lighting controls observed consists of manual on/off toggle switches. No automatic lighting controls or dimming was observed.

Recommendations

Replace the existing lighting throughout the building interior and exterior with new LED lights to increase building efficiency. Add LED lighting poles and LED building mount lights to increase site illumination. Evaluate the existing emergency lighting coverage throughout the building and add fixtures where lighting is inadequate. Replace the existing lighting controls with dimmable switches and automatic occupancy/vacancy sensors to meet modern energy code and increase user comfort.

Fire Alarm

Observations

The existing Simplex 4010 horn/strobe fire alarm control panel appeared to be in good working condition. Existing notification/detection coverage appeared to meet minimum code requirements.

Recommendations
Modern building code would require a fire alarm system utilizing voice evacuation for an occupancy of this type; however, since the current horn/strobe system met code at the time of installation, it is grandfathered in. Typically, an upgrade to voice evacuation would only be required under significant renovations. An elective upgrade would be to replace the fire alarm system with a new voice evacuation system to meet current code and enhance building safety. Besides this, no recommendations for improvement.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT) SYSTEMS

Structured Cabling

Observations
The main distribution frame was observed during the facility tour which consisted of (1) two post rack to support structured cabling and network hardware. This equipment was in good condition and had spare physical capacity for expansion.

Voice/data infrastructure throughout the building is minimal. Classrooms typically consisted of (1) 2-port data outlet to serve a wireless access point and IP phone. Wireless access points have been installed throughout the building and it was noted that network connectivity is adequate. Structured cabling observed consisted of a mix of Category 5e and 6 grade.

Recommendations
Add (1)-(2) data outlets in classrooms to support current and future classroom technology needs. Add network racks and associated hardware to support the new infrastructure.

Communications

Observations
The existing paging system was not tested during the tour; however, it was noted by facilities that the existing head-end is operational but does not integrate with the phone system and is obsolete without spare parts or maintenance technicians available. Lapses in paging coverage throughout the building were also noted. The building centralized clock system has continual maintenance and synchronization issues.

Recommendations
Replace the existing paging system with new and increase audible coverage throughout the building. Replace the existing clock system with new modern centralized wired/wireless system.

Security

Observations
A video surveillance system consisting of Axis cameras has been installed throughout the building within the last couple of years and appeared to be in good working condition.

No centralized access control system is installed. An existing AI phone intercom-master station controls access at the main entrance. The main entrance does not have a secure vestibule.

No intrusion detection system was observed.

Recommendations

Add additional video surveillance cameras at select locations and areas of concern.

Add centralized access control system at high use entrances/exits to create a secure building perimeter. Implement a secure vestibule at the main entrance.

Install a small-scale intrusion detection system to cover main entrance/exit areas and other select spaces.

	Date of Assessment:	3/7/2024			
	SCHOOL SAFETY ASSESSMENT				
		YES	**NO**	**N/A**	**COMMENTS**
1	School grounds are fenced.	X			
2	There is one clearly marked and designated entrance for visitors.		X		
3	Signs are posted for visitors to report to main office through a designated entrance.		X		
4	Restricted areas are clearly marked.		X		
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)			X	
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.			X	
7	Bus loading and drop-off zones are clearly defined.		X		
8	There is a schedule for maintenance of:				
	a. Outside lights		X		Staff report as needed
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.		X		
10	There is adequate lighting around the building.	X			
11	Lighting is provided at entrances and other points of possible intrusion.	X			
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.	X			
15	Playground equipment has tamper-proof fasteners.	X			
16	Visual surveillance of bicycle racks from main office is possible.	X			By camera
17	Visual surveillance of parking lots from main office is possible.	X			By camera
18	Parking lot is lighted properly and all lights are functioning.	X			
19	Accessible lenses are protected by some unbreakable material.		X		
20	Staff and visitor parking has been designated.	X			
21	Outside hardware has been removed from all doors except at points of entry.		X		
22	Ground floor windows:				
	a. have no broken panes;	X			
	b. have locking hardware that is in working order.	X			
23	Basement windows are protected with grill or well cover.		X		
24	Doors are locked when classrooms are vacant.	X			Often left open
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office	X			
	b. Cafeteria		X		No alarm
	c. Computer labs		X		No alarm
	d. Industrial arts rooms			X	
	e. Science labs			X	
	f. Nurses office		X		No alarm
	g. Boiler room		X		No alarm
	h. Electrical rooms		X		No alarm
	i. Phone line access closet				No alarm, usually left open
26	Unused areas of the school can be closed off during after school activities.	X			
27	There is two-way communication between the main office and:				
	a. Classrooms	X			By radio
	b. Duty stations	X			By radio
	c. Re-locatable classrooms			X	
	d. Staff and faculty outside building	X			By radio
	e. Buses				
28	There is a central alarm system in the school. If yes, briefly describe in Comments.	X			Alarm for principal's office and main hall
29	The main entrance is visible from the main office.		X		Only by camera

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	X			
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).		X		
3	There is at least 1 van accessible parking space among the accessible spaces.		X		
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.		X		
5	The access aisles adjoin an accessible route.		X		
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.			X	
7	There are signs reading "van accessible" at van accessible spaces.	X			
8	If the accessible route crosses a curb, there is a curb ramp.	X			
9	Ramps are sloped no greater than 1:12.		X		
10	The main entrance is accessible.		X		
11	If the main entrance is not accessible, there is an alternative accessible entrance.	X			
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.		X		
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.	X			
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.		X		
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.		X		
16	In locker rooms, there is at least one room with a bench.		X		
17	At least one toilet room is accessible (either one for each sex or one unisex).	X			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.		X		
19	There is a route to the accessible toilet room(s) that does not include stairs.	X			
20	The door can be opened easily (5 lbs. maximum force).		X		
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.		X		
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.		X

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?			X	
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X

SCHOOL SAFETY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	School grounds are fenced.		X		
2	There is one clearly marked and designated entrance for visitors.	X			
3	Signs are posted for visitors to report to main office through a designated entrance.		X		
4	Restricted areas are clearly marked.	X			
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)	X			
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.	X			
7	Bus loading and drop-off zones are clearly defined.	X			
8	There is a schedule for maintenance of:				
	a. Outside lights		X		Staff report maintenance as needed
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.	X			
10	There is adequate lighting around the building.	X			
11	Lighting is provided at entrances and other points of possible intrusion.	X			
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.	X			
15	Playground equipment has tamper-proof fasteners.	X			
16	Visual surveillance of bicycle racks from main office is possible.	X			
17	Visual surveillance of parking lots from main office is possible.	X			With cameras
18	Parking lot is lighted properly and all lights are functioning.	X			
19	Accessible lenses are protected by some unbreakable material.		X		
20	Staff and visitor parking has been designated.		X		
21	Outside hardware has been removed from all doors except at points of entry.	X			
22	Ground floor windows:				
	a. have no broken panes;		X		
	b. have locking hardware that is in working order.	X			
23	Basement windows are protected with grill or well cover.			X	
24	Doors are locked when classrooms are vacant.	X			
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office		X		Surveillance only via camera
	b. Cafeteria		X		
	c. Computer labs		X		
	d. Industrial arts rooms		X		
	e. Science labs		X		
	f. Nurses office		X		
	g. Boiler room		X		
	h. Electrical rooms		X		
	i. Phone line access closet		X		
26	Unused areas of the school can be closed off during after school activities.		X		
27	There is two-way communication between the main office and:				
	a. Classrooms		X		
	b. Duty stations		X		
	c. Re-locatable classrooms		X		
	d. Staff and faculty outside building		X		
	e. Buses		X		
28	There is a central alarm system in the school. If yes, briefly describe in Comments.	X			Not maintained at this time. Outdated, prone to false alarm, some stations non-functional
29	The main entrance is visible from the main office.	X

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	X			AT GYM PARKING LOT
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).	X			AT GYM PARKING LOT
3	There is at least 1 van accessible parking space among the accessible spaces.	X			AT GYM PARKING LOT
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.	X			
5	The access aisles adjoin an accessible route.	X			
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.	X			
7	There are signs reading "van accessible" at van accessible spaces.	X			
8	If the accessible route crosses a curb, there is a curb ramp.	X			
9	Ramps are sloped no greater than 1:12.	X			
10	The main entrance is accessible.	X			
11	If the main entrance is not accessible, there is an alternative accessible entrance.	X			
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.		X		
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.	X			
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.	X	X		AT GYM BUILDING NOT AT FRONT ENTRY OF SCHOOL
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.	X			
16	In locker rooms, there is at least one room with a bench.	X			
17	At least one toilet room is accessible (either one for each sex or one unisex).	X			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.	X			
19	There is a route to the accessible toilet room(s) that does not include stairs.	X			
20	The door can be opened easily (5 lbs. maximum force).	X	X		AT GYM BUILDING NOT AT
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.	X	X		VARIES
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.	X	X		VARIES

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?		X		
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X

Item	Data	Notes / Explanation
District Name:	Morrow SD 1	Pull-down menu of the 197 Districts and 19 ESDs (alphabetical order)
Site Name:	Heppner Jr./Sr. High School	Typically the name that is used for the facility / campus
Building Name:	Heppner Jr./Sr. High School	If only one building on site, refer to "main"
Building ID:	21470400	Use the School Facilities Building Collection Building ID Number (BIN) Lookup Tool for the eight (8) digit number assigned to the building. To use the tool, first download a copy of it by selecting File -> Save As -> Download a Copy. At the top of the Lookup Tool, enter the District ID which you can find on the Entity ID tab.
Building Type:	High School	Pull-down menu - feeds FCI calculation
Physical Address of Building:	710 NW Morgan Street, Heppner, OR 97836	Informational only - does not link
Original Year of Building Completion:	1962	When was the original building completed and ready for use
Primary Structure Type:		Pull-down menu of primary building construction / structure types
Secondary Structure Type:		Pull-down menu of secondary building construction / structure types
County:	Morrow	Pull-down menu of the 36 counties - sets location factor for budgets
Gross Square Footage:	59,292	Calculated from exterior face of walls (excluding eaves, outbuilding, porches, canopies, and similar)
Site Acreage:	30.85	District records
Assessor Company:	Wenaha Group	
Assessor Name:	Cassie Hibbert	For follow up questions
Contact (Phone):	541.561.3497	
Contact (E-Mail):	chibbert@wenahagroup.com	
Date of Assessment:	2/9/2024	Enter the actual date of the assessment - use m/d/yyyy format

District Name:	Morrow SD 1
Site Name:	Heppner Jr./Sr. High School
Building Name:	Heppner Jr./Sr. High School
Building ID:	21470400
Date of Estimate:	2/9/2024

SCHOOL SAFETY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	School grounds are fenced.		X		
2	There is one clearly marked and designated entrance for visitors.		X		
3	Signs are posted for visitors to report to main office through a designated entrance.	X			Ring bell
4	Restricted areas are clearly marked.		X		
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)	X			
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.	X			
7	Bus loading and drop-off zones are clearly defined.	X			
8	There is a schedule for maintenance of:				
	a. Outside lights		X		Staff report as needed
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.		X		
10	There is adequate lighting around the building.	X			
11	Lighting is provided at entrances and other points of possible intrusion.	X			
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.		X		
15	Playground equipment has tamper-proof fasteners.		X		
16	Visual surveillance of bicycle racks from main office is possible.			X	No bike racks
17	Visual surveillance of parking lots from main office is possible.	X			Via camera
18	Parking lot is lighted properly and all lights are functioning.	X			
19	Accessible lenses are protected by some unbreakable material.		X		
20	Staff and visitor parking has been designated.		X		
21	Outside hardware has been removed from all doors except at points of entry.		X		
22	Ground floor windows:				
	a. have no broken panes;	X			
	b. have locking hardware that is in working order.	X			
23	Basement windows are protected with grill or well cover.			X	
24	Doors are locked when classrooms are vacant.	X			
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office	X			Alarm only
	b. Cafeteria		X		
	c. Computer labs		X		
	d. Industrial arts rooms		X		
	e. Science labs		X		
	f. Nurses office		X		
	g. Boiler room		X		
	h. Electrical rooms		X		
	i. Phone line access closet		X		
26	Unused areas of the school can be closed off during after school activities.	X			
27	There is two-way communication between the main office and:				
	a. Classrooms	X			Phones
	b. Duty stations			X	
	c. Re-locatable classrooms			X	
	d. Staff and faculty outside building		X		
	e. Buses		X		
28	There is a central alarm system in the school. If yes, briefly describe in Comments.	X			Office only
29	The main entrance is visible from the main office.	X

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	X			
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).		X		
3	There is at least 1 van accessible parking space among the accessible spaces.		X		
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.		X		
5	The access aisles adjoin an accessible route.		X		
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.	X			
7	There are signs reading "van accessible" at van accessible spaces.		X		
8	If the accessible route crosses a curb, there is a curb ramp.	X			
9	Ramps are sloped no greater than 1:12.		X		
10	The main entrance is accessible.		X		
11	If the main entrance is not accessible, there is an alternative accessible entrance.	X			
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.		X		
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.	X			
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.		X		
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.		X		
16	In locker rooms, there is at least one room with a bench.	X			
17	At least one toilet room is accessible (either one for each sex or one unisex).	X			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.	X			
19	There is a route to the accessible toilet room(s) that does not include stairs.	X			
20	The door can be opened easily (5 lbs. maximum force).		X		
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.	X	X		VARIES
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.	X	X

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?			X	
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X

Item	Data	Notes / Explanation
District Name:	Morrow SD 1	Pull-down menu of the 197 Districts and 19 ESDs (alphabetical order)
Site Name:	Irrigon Elementary School	Typically the name that is used for the facility / campus
Building Name:	Irrigon Elementary School	If only one building on site, refer to "main"
Building ID:	21470800	Use the School Facilities Building Collection Building ID Number (BIN) Lookup Tool for the eight (8) digit number assigned to the building. To use the tool, first download a copy of it by selecting File -> Save As -> Download a Copy. At the top of the Lookup Tool, enter the District ID which you can find on the Entity ID tab.
Building Type:	Elementary School	Pull-down menu - feeds FCI calculation
Physical Address of Building:	490 SE Wyoming, Irrigon, OR 97844	Informational only - does not link
Original Year of Building Completion:	2003	When was the original building completed and ready for use
Primary Structure Type:		Pull-down menu of primary building construction / structure types
Secondary Structure Type:		Pull-down menu of secondary building construction / structure types
County:	Morrow	Pull-down menu of the 36 counties - sets location factor for budgets
Gross Square Footage:	37,594	Calculated from exterior face of walls (excluding eaves, outbuilding, porches, canopies, and similar)
Site Acreage:	???	District records
Assessor Company:	Wenaha Group	
Assessor Name:	Cassie Hibbert	For follow up questions

SCHOOL SAFETY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	School grounds are fenced.	X			
2	There is one clearly marked and designated entrance for visitors.	X			
3	Signs are posted for visitors to report to main office through a designated entrance.	X			
4	Restricted areas are clearly marked.		X		
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)	X			
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.	X			
7	Bus loading and drop-off zones are clearly defined.	X			
8	There is a schedule for maintenance of:				
	a. Outside lights		X		Staff report as needed
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.	X			
10	There is adequate lighting around the building.	X			
11	Lighting is provided at entrances and other points of possible intrusion.	X			
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.	X			
15	Playground equipment has tamper-proof fasteners.	X			
16	Visual surveillance of bicycle racks from main office is possible.	X			
17	Visual surveillance of parking lots from main office is possible.	X			
18	Parking lot is lighted properly and all lights are functioning.	X			
19	Accessible lenses are protected by some unbreakable material.				
20	Staff and visitor parking has been designated.	X			
21	Outside hardware has been removed from all doors except at points of entry.			X	
22	Ground floor windows:				
	a. have no broken panes;	X			
	b. have locking hardware that is in working order.	X			
23	Basement windows are protected with grill or well cover.			X	
24	Doors are locked when classrooms are vacant.	X			
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office	X			
	b. Cafeteria		X		
	c. Computer labs		X		
	d. Industrial arts rooms			X	
	e. Science labs			X	
	f. Nurses office	X			
	g. Boiler room	X			
	h. Electrical rooms	X			
	i. Phone line access closet	X			
26	Unused areas of the school can be closed off during after school activities.		X		
27	There is two-way communication between the main office and:				
	a. Classrooms	X			
	b. Duty stations	X			
	c. Re-locatable classrooms	X			
	d. Staff and faculty outside building	X			
	e. Buses		X		
28	There is a central alarm system in the school. If yes, briefly describe in Comments.	X			
29	The main entrance is visible from the main office.	X

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	X			
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).	X			
3	There is at least 1 van accessible parking space among the accessible spaces.	X			
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.	X			
5	The access aisles adjoin an accessible route.	X			
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.	X			
7	There are signs reading "van accessible" at van accessible spaces.	X			
8	If the accessible route crosses a curb, there is a curb ramp.	X			
9	Ramps are sloped no greater than 1:12.	X			
10	The main entrance is accessible.	X			
11	If the main entrance is not accessible, there is an alternative accessible entrance.			X	
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.			X	
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.		X		
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.	X			
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.	X			
16	In locker rooms, there is at least one room with a bench.			X	
17	At least one toilet room is accessible (either one for each sex or one unisex).	X			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.	X			
19	There is a route to the accessible toilet room(s) that does not include stairs.	X			
20	The door can be opened easily (5 lbs. maximum force).	X			
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.	X			
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.	X

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?			X	
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X

SCHOOL SAFETY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	School grounds are fenced.		X		Partially
2	There is one clearly marked and designated entrance for visitors.		X		
3	Signs are posted for visitors to report to main office through a designated entrance.	X			
4	Restricted areas are clearly marked.		X		
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)	X			
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.	X			
7	Bus loading and drop-off zones are clearly defined.		X		
8	There is a schedule for maintenance of:				
	a. Outside lights		X		Staff report as needed
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.		X		
10	There is adequate lighting around the building.		X		
11	Lighting is provided at entrances and other points of possible intrusion.	X			Dim lighting
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.			X	
15	Playground equipment has tamper-proof fasteners.			X	
16	Visual surveillance of bicycle racks from main office is possible.	X			
17	Visual surveillance of parking lots from main office is possible.	X			
18	Parking lot is lighted properly and all lights are functioning.		X		
19	Accessible lenses are protected by some unbreakable material.	X			
20	Staff and visitor parking has been designated.	X			
21	Outside hardware has been removed from all doors except at points of entry.	X			
22	Ground floor windows:				
	a. have no broken panes;	X			
	b. have locking hardware that is in working order.			X	
23	Basement windows are protected with grill or well cover.			X	
24	Doors are locked when classrooms are vacant.	X			
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office		X		
	b. Cafeteria		X		
	c. Computer labs		X		
	d. Industrial arts rooms		X		
	e. Science labs		X		
	f. Nurses office		X		
	g. Boiler room		X		
	h. Electrical rooms		X		
	i. Phone line access closet		X		
26	Unused areas of the school can be closed off during after school activities.	X			
27	There is two-way communication between the main office and:				
	a. Classrooms	X			
	b. Duty stations	X			
	c. Re-locatable classrooms	X			
	d. Staff and faculty outside building	X			
	e. Buses		X		
28	There is a central alarm system in the school. If yes, briefly describe in Comments.		X		
29	The main entrance is visible from the main office.	X

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	X			
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).		X		AND STRIPING IS FADED AND NOT CURRENT
3	There is at least 1 van accessible parking space among the accessible spaces.		X		
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.		X		
5	The access aisles adjoin an accessible route.		X		STRIPING IS FADED AND NOT
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.		X		
7	There are signs reading "van accessible" at van accessible spaces.		X		
8	If the accessible route crosses a curb, there is a curb ramp.	X			
9	Ramps are sloped no greater than 1:12.	X			
10	The main entrance is accessible.	X			
11	If the main entrance is not accessible, there is an alternative accessible entrance.			X	
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.			X	
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.		X		
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.		X		
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.		X		
16	In locker rooms, there is at least one room with a bench.	X			
17	At least one toilet room is accessible (either one for each sex or one unisex).	X			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.		X		
19	There is a route to the accessible toilet room(s) that does not include stairs.		X		NOT IN LOWER SECTION
20	The door can be opened easily (5 lbs. maximum force).		X		
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.		X		
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.		X

Date of Assessment:	3/7/2024

HARMFUL SUBSTANCES ASSESSMENT

		YES	NO	N/A	COMMENTS
1	**Lead**				
	Has your facility been assessed for lead? If so when?		X		
	Is there lead in your facility?	X			
	Is lead abatement included in your future bond plans?				TBD
2	**Asbestos**				
	Has your facility been assessed for asbestos? If so when?	X			As needed
	Is there asbestos in your facility?	X			
	Is asbestos abatement included in your future bond plans?				TBD
3	**Mold**				
	Has your facility been assessed for mold? If so when?		X		
	Is there mold in your facility?				
	Is mold abatement included in your future bond plans?				TBD
4	**Water Quality**				
	Has your facility been assessed for water quality (lead, etc.)? If so when?	X			2016,2019,2020
	Is there a water quality concern in your facility?		X		
	Is water treatment included in your future bond plans?		X		
5	**Polychlorinated Biphenyls (PCBs)**				
	Has your facility been assessed for PCBs? If so when?		X		
	Are there PCBs in your facility?				
	Is PCB abatement included in your future bond plans?				TBD
6	**Radon**				
	Has your facility been tested for radon? If so when?	X			2019
	Are there elevated levels of radon (above 4 pCi/L) in your facility?		X		
	Is radon mitigation included in your future bond plans?		X		

District Name:	Morrow SD 1

Date of Assessment:	3/7/2024

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?			X	
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X	

Base Information

Item	Data	Notes / Explanation
District Name:	Morrow SD 1	Pull-down menu of the 197 Districts and 19 ESDs (alphabetical order)
Site Name:	Riverside Jr./Sr. High School	Typically the name that is used for the facility / campus
Building Name:	Riverside Jr./Sr. High School	If only one building on site, refer to "main"
Building ID:	21470600	Use the School Facilities Building Collection Building ID Number (BIN) Lookup Tool for the eight (8) digit number assigned to the building. To use the tool, first download a copy of it by selecting File -> Save As -> Download a Copy. At the top of the Lookup Tool, enter the District ID which you can find on the Entity ID tab.
Building Type:	High School	Pull-down menu - feeds FCI calculation
Physical Address of Building:	210 Boardman Ave. NE, Boardman, OR 97818	Informational only - does not link
Original Year of Building Completion:	1968	When was the original building completed and ready for use
Primary Structure Type:		Pull-down menu of primary building construction / structure types
Secondary Structure Type:		Pull-down menu of secondary building construction / structure types
County:	Morrow	Pull-down menu of the 36 counties - sets location factor for budgets
Gross Square Footage:	88,760	Calculated from exterior face of walls (excluding eaves, outbuilding, porches, canopies, and similar)
Site Acreage:	37	District records
Assessor Company:	Wenaha Group	
Assessor Name:	Cassie Hibbert	For follow up questions
Contact (Phone):	541.561.3497	
Contact (E-Mail):	chibbert@wenahagroup.com	
Date of Assessment:	3/8/2024	Enter the actual date of the assessment - use m/d/yyyy format

District Name:	Morrow SD 1

SCHOOL SAFETY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	School grounds are fenced.	X			Partially
2	There is one clearly marked and designated entrance for visitors.		X		
3	Signs are posted for visitors to report to main office through a designated entrance.	X			
4	Restricted areas are clearly marked.			X	
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)	X			
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.	X			
7	Bus loading and drop-off zones are clearly defined.		X		
8	There is a schedule for maintenance of:				
	a. Outside lights		X		Staff report as needed
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.				
10	There is adequate lighting around the building.	X			
11	Lighting is provided at entrances and other points of possible intrusion.	X			
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.			X	
15	Playground equipment has tamper-proof fasteners.			X	
16	Visual surveillance of bicycle racks from main office is possible.		X		Cameras only
17	Visual surveillance of parking lots from main office is possible.		X		Cameras only
18	Parking lot is lighted properly and all lights are functioning.	X			
19	Accessible lenses are protected by some unbreakable material.			X	
20	Staff and visitor parking has been designated.		X		
21	Outside hardware has been removed from all doors except at points of entry.		X		Many exterior doors
22	Ground floor windows:				
	a. have no broken panes;	X			
	b. have locking hardware that is in working order.	X			
23	Basement windows are protected with grill or well cover.			X	
24	Doors are locked when classrooms are vacant.	X			
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office	X			
	b. Cafeteria		X		
	c. Computer labs	X			
	d. Industrial arts rooms	X			
	e. Science labs		X		
	f. Nurses office		X		
	g. Boiler room		X		
	h. Electrical rooms		X		
	i. Phone line access closet		X		
26	Unused areas of the school can be closed off during after school activities.	X			
27	There is two-way communication between the main office and:				
	a. Classrooms	X			
	b. Duty stations	X			
	c. Re-locatable classrooms		X		Phone only/radios
	d. Staff and faculty outside building	X			
	e. Buses		X		
28	There is a central alarm system in the school. If yes, briefly describe in Comments.	X			Burglar/fire
29	The main entrance is visible from the main office.		X		Camera only

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	x			
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).	x			
3	There is at least 1 van accessible parking space among the accessible spaces.	x			
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.	x			
5	The access aisles adjoin an accessible route.	x			
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.	x			
7	There are signs reading "van accessible" at van accessible spaces.	x			
8	If the accessible route crosses a curb, there is a curb ramp.	x			
9	Ramps are sloped no greater than 1:12.	x			
10	The main entrance is accessible.	x			
11	If the main entrance is not accessible, there is an alternative accessible entrance.			x	
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.			x	
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.	x			
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.		x		
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.	x			
16	In locker rooms, there is at least one room with a bench.		x		
17	At least one toilet room is accessible (either one for each sex or one unisex).	x			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.	x			
19	There is a route to the accessible toilet room(s) that does not include stairs.	x			
20	The door can be opened easily (5 lbs. maximum force).	x			
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.	x			
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?			X	
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X

Date of Assessment:	3/8/2024

SCHOOL SAFETY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	School grounds are fenced.	X			
2	There is one clearly marked and designated entrance for visitors.	X			
3	Signs are posted for visitors to report to main office through a designated entrance.	X			
4	Restricted areas are clearly marked.	X			
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)	X			
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.	X			
7	Bus loading and drop-off zones are clearly defined.	X			
8	There is a schedule for maintenance of:				
	a. Outside lights		X		Staff report as needed
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.		X		
10	There is adequate lighting around the building.	X			
11	Lighting is provided at entrances and other points of possible intrusion.	X			
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.	X			
15	Playground equipment has tamper-proof fasteners.	X			
16	Visual surveillance of bicycle racks from main office is possible.	X			
17	Visual surveillance of parking lots from main office is possible.		X		Not lower parking
18	Parking lot is lighted properly and all lights are functioning.	X			
19	Accessible lenses are protected by some unbreakable material.	X			
20	Staff and visitor parking has been designated.	X			Mostly
21	Outside hardware has been removed from all doors except at points of entry.			X	
22	Ground floor windows:				
	a. have no broken panes;	X			
	b. have locking hardware that is in working order.	X			
23	Basement windows are protected with grill or well cover.			X	
24	Doors are locked when classrooms are vacant.	X			
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office	X			
	b. Cafeteria		X		
	c. Computer labs			X	
	d. Industrial arts rooms			X	
	e. Science labs			X	
	f. Nurses office	X			No alarms
	g. Boiler room	X			No alarms
	h. Electrical rooms	X			No alarms
	i. Phone line access closet	X			
26	Unused areas of the school can be closed off during after school activities.	X			
27	There is two-way communication between the main office and:				
	a. Classrooms	X			
	b. Duty stations			X	
	c. Re-locatable classrooms			X	
	d. Staff and faculty outside building	X			Radios
	e. Buses		X		Communicate with bus
28	There is a central alarm system in the school. If yes, briefly describe in Comments.	X			Halls and office
29	The main entrance is visible from the main office.		X		Not directly

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	x			
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).	x			
3	There is at least 1 van accessible parking space among the accessible spaces.	x			
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.	x			
5	The access aisles adjoin an accessible route.	x			
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.	x			
7	There are signs reading "van accessible" at van accessible spaces.	x			
8	If the accessible route crosses a curb, there is a curb ramp.	x			
9	Ramps are sloped no greater than 1:12.	x			
10	The main entrance is accessible.		x		
11	If the main entrance is not accessible, there is an alternative accessible entrance.		x		
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.		x		
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.		x		
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.		x		
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.		x		
16	In locker rooms, there is at least one room with a bench.			x	
17	At least one toilet room is accessible (either one for each sex or one unisex).	x			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.	x			
19	There is a route to the accessible toilet room(s) that does not include stairs.	x			
20	The door can be opened easily (5 lbs. maximum force).		x		
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.	x			
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.		x

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?			X	
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X

SCHOOL SAFETY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	School grounds are fenced.	X			Partially
2	There is one clearly marked and designated entrance for visitors.		X		
3	Signs are posted for visitors to report to main office through a designated entrance.	X			
4	Restricted areas are clearly marked.		X		
5	Shrubs and foliage are trimmed to allow for good line of sight. (3'-0"/8'- 0" rule)	X			
6	Shrubs near building have been trimmed "up" to allow view of bottom of building.			X	
7	Bus loading and drop-off zones are clearly defined.	X			
8	There is a schedule for maintenance of:				
	a. Outside lights		X		
	b. Locks/Hardware		X		
	c. Storage Sheds		X		
	d. Windows		X		
	e. Other exterior buildings		X		
9	Parent drop-off and pick-up area is clearly defined.	X			
10	There is adequate lighting around the building.	X			
11	Lighting is provided at entrances and other points of possible intrusion.	X			
12	The school ground is free from trash or debris.	X			
13	The school is free of graffiti.	X			
14	Play areas are fenced.		X		
15	Playground equipment has tamper-proof fasteners.	X			
16	Visual surveillance of bicycle racks from main office is possible.		X		
17	Visual surveillance of parking lots from main office is possible.		X		
18	Parking lot is lighted properly and all lights are functioning.	X			
19	Accessible lenses are protected by some unbreakable material.	X			
20	Staff and visitor parking has been designated.	X			
21	Outside hardware has been removed from all doors except at points of entry.		X		
22	Ground floor windows:				
	a. have no broken panes;	X			
	b. have locking hardware that is in working order.			X	
23	Basement windows are protected with grill or well cover.			X	
24	Doors are locked when classrooms are vacant.	X			
25	High-risk areas are protected by high security locks and an alarm system:				
	a. Main office	X			
	b. Cafeteria		X		
	c. Computer labs			X	
	d. Industrial arts rooms	X			
	e. Science labs			X	
	f. Nurses office	X			
	g. Boiler room	X			
	h. Electrical rooms	X			
	i. Phone line access closet		X		
26	Unused areas of the school can be closed off during after school activities.		X		
27	There is two-way communication between the main office and:				
	a. Classrooms	X			
	b. Duty stations	X			
	c. Re-locatable classrooms	X			
	d. Staff and faculty outside building	X			
	e. Buses				
28	There is a central alarm system in the school. If yes, briefly describe in Comments.				
29	The main entrance is visible from the main office.	X

ADA ASSESSMENT

		YES	NO	N/A	COMMENTS
1	There is at least 1 route from site arrival points that does not require the use of stairs.	x			
2	If parking is provided for the public, there are an adequate number of accessible spaces provided (1 per 25).	x			
3	There is at least 1 van accessible parking space among the accessible spaces.		x		
4	The slope of the accessible parking spaces and access aisles is no steeper than 1:48 in all directions.	x			
5	The access aisles adjoin an accessible route.	x			
6	Accessible spaces are identified with a sign that includes the International Symbol of Accessibility.	x			
7	There are signs reading "van accessible" at van accessible spaces.		x		
8	If the accessible route crosses a curb, there is a curb ramp.	x			
9	Ramps are sloped no greater than 1:12.	x			
10	The main entrance is accessible.	x			
11	If the main entrance is not accessible, there is an alternative accessible entrance.			x	
12	The alternative accessible entrance can be used independently and during the same hours as the main entrance.			x	
13	All inaccessible entrances have signs with the International Symbol of Accessibility indicating the location of the nearest accessible entrance.	x			
14	The door is equipped with hardware, including locks, that is operable with one hand and does not require tight grasping, pinching, or twisting of the wrist.	x			
15	The operable parts of the door hardware are no less than 34" and no greater than 48" above the floor or ground surface.	x			
16	In locker rooms, there is at least one room with a bench.			x	
17	At least one toilet room is accessible (either one for each sex or one unisex).	x			
18	There are signs with the International Symbol of Accessibility at inaccessible toilet rooms that give directions to accessible toilet rooms.	x			
19	There is a route to the accessible toilet room(s) that does not include stairs.	x			
20	The door can be opened easily (5 lbs. maximum force).	x			
21	Lighting controls are operable with one hand and without tight grasping, pinching, or twisting of the wrist.	x			
22	Mounted switches are no less than 34" and no greater than 48" above the floor or ground surface.

INFORMATION TECHNOLOGY ASSESSMENT

	YES	NO	N/A	COMMENTS
1 Connectivity "speed" to the Facility – measured by Megabytes per second (Mbps):				
a. 10,000 Mbps or greater		X		
b. 1,000 to 9,999 Mbps	X			
c. 100 to 999 Mbps		X		
d. 10 to 99 Mbps		X		
e. 1 to 9 Mbps		X		
2 Local area network connectivity "speed" at the individual building level:				
a. 10,000 Mbps or greater		X		
b. 1,000 to 9,999 Mbps	X			
c. 100 to 999 Mbps		X		
d. 10 to 99 Mbps		X		
e. 1 to 9 Mbps		X		
3 Wireless Coverage:				
a. Facility-wide	X			
b. Secure?	X			
c. Type:				
i. AC wireless router	X			And Wifi6 (AX)
ii. N wireless router		X		
iii. A/B/G wireless router		X		
4 Building cabling:				
a. Fiber (to the desktop)		X		
b. CAT 6		X		
c. CAT 5 E	X			
d. CAT 5		X		
5 Security:				
a. Access control		X		
b. Video Surveillance	X			
c. Central Communications Systems	X

INDOOR AIR QUALITY ASSESSMENT

		YES	NO	N/A	COMMENTS
1	Is someone designated to develop and implement an indoor air quality management plan for your school district?	X			
2	Does your district have an indoor air quality management plan that includes steps for preventing and resolving indoor air quality problems?		X		
3	Are school buildings inspected once or twice each year for conditions that may lead to indoor air quality problems?		X		
4	Is a preventive maintenance schedule established and in operation for the heating, ventilation, and air conditioning (HVAC) system? Is the schedule in accordance with the manufacturer's recommendations or accepted practice for the HVAC system?	X			
5	Does the HVAC preventive maintenance schedule include checking and/or changing air filters and belts, lubricating equipment parts, checking the motors, and confirming that all equipment is in operating order?	X			
6	Is the maintenance schedule updated to show all maintenance performed on the building systems?	X			
7	Does the maintenance schedule include the dates that the building systems maintenance was performed and the names of the persons or companies performing the work?	X			
8	Are maintenance schedules retained for at least three years?	X			
9	Are damaged or inoperable components of the HVAC system replaced or repaired as appropriate?	X			
10	Are reservoirs or parts of the HVAC system with standing water checked visually for microbial growth?			X	
11	Are water leaks that could promote the growth of biological agents promptly repaired?	X			
12	Are damp or wet materials that could promote the growth of biological agents promptly dried, replaced, removed, or cleaned?	X			
13	Are microbial contaminants removed from ductwork, humidifiers, other HVAC and building system components, and from building surfaces such as carpeting and ceiling tiles when found during regular or emergency maintenance activities or visual inspection?	X			
14	Is general or local exhaust ventilation used where housekeeping and maintenance activities could reasonably be expected to result in exposure to hazardous substances above applicable exposure limits?	X			
15	Does the HVAC system have CO2 monitoring capability (demand control ventilation)?	X			
16	Are humidity levels maintained between 30% to 60% relative humidity?	X			
17	When a contaminant is identified in the make-up air supply, is the source of the contaminant eliminated, or are the make-up inlets or exhaust air outlets relocated to avoid entry of the contaminant into the air system?			X	
18	If buildings do not have mechanical ventilation, are windows, doors, vents, stacks, and other portals used for natural ventilation operating properly?			X
