

Bristol Public Schools
Office of Teaching & Learning

Department	K-5 Science
Department Philosophy	<p>Bristol Public Schools science program provides students with knowledge of the science and engineering practices, crosscutting concepts, and core ideas of science and engineering to engage in public discussions on science related issues, to be critical consumers of scientific information related to their everyday lives, and continue to learn science throughout their lives. To ensure this level of scientific literacy, Bristol Public Schools anchor science units in phenomena, this practice promotes student ownership of learning and supports student application of science content as it pertains to the real world. In each science unit, students work to explain phenomena through the applications of the three dimensions of the Next Generation Science Standards: (1) science and engineering practices, (2) disciplinary core ideas, and (3) cross cutting concepts. Bristol's use phenom-based units and the three dimensions ensure that students connect with and build a deep conceptual understanding of science concepts. Throughout the kindergarten through grade 12 experience, this philosophy provides all Bristol students with the skills and concepts to be scientifically literate adults.</p>
Course	Grade 3 NGSS Science
Course Description for Program of Studies	<p>The performance expectations in third grade help students formulate answers to questions such as:</p> <p>What is typical weather in different parts of the world and during different times of the year? How can the impact of weather-related hazards be reduced? How do organisms vary in their traits? How are plants, animals, and environments of the past similar or different from current plants, animals, and environments? What happens to organisms when their environment changes? How do equal and unequal forces on an object affect the object? How can magnets be used?"</p> <p>Third grade performance expectations include PS2, LS1, LS2, LS3, LS4, ESS2, and ESS3 Disciplinary Core Ideas from the NRC Framework. Students are able to organize and use data to describe typical weather conditions expected during a particular season. By applying their understanding of weather-related hazards, students are able to make a claim about the merit of a</p>

	<p>design solution that reduces the impacts of such hazards. Students are expected to develop an understanding of the similarities and differences of organisms' life cycles. An understanding that organisms have different inherited traits, and that the environment can also affect the traits that an organism develops, is acquired by students at this level. In addition, students are able to construct an explanation using evidence for how the variations in characteristics among individuals of the same species may provide advantages in surviving, finding mates, and reproducing. Students are expected to develop an understanding of types of organisms that lived long ago and also about the nature of their environments. Third graders are expected to develop an understanding of the idea that when the environment changes some organisms survive and reproduce, some move to new locations, some move into the transformed environment, and some die. Students are able to determine the effects of balanced and unbalanced forces on the motion of an object and the cause and effect relationships of electric or magnetic interactions between two objects not in contact with each other. They are then able to apply their understanding of magnetic interactions to define a simple design problem that can be solved with magnets. The crosscutting concepts of patterns; cause and effect; scale, proportion, and quantity; systems and system models; interdependence of science, engineering, and technology; and influence of engineering, technology, and science on society and the natural world are called out as organizing concepts for these disciplinary core ideas. In the third grade performance expectations, students are expected to demonstrate grade-appropriate proficiency in asking questions and defining problems; developing and using models, planning and carrying out investigations, analyzing and interpreting data, constructing explanations and designing solutions, engaging in argument from evidence, and obtaining, evaluating, and communicating information. Students are expected to use these practices to demonstrate understanding of the core ideas.</p> <p><u>Items in bold are a priority</u></p>

Solve one- and two-step “how many more” and “how many less” problems using information presented in bar graphs. (3-ESS2-1) 				

UNIT 1 DETAILS

Unit Phenomenon: The Case of Odd Motion

Storyline:

Students are introduced to three instances of odd motion; acting as secret agents, the students work towards solving the causes of these motions as they gain an understanding of forces and motion. Students investigate the role of strength and direction of forces on resulting motion. They will explore how properties of the object itself impact motion and the amount of force needed to set the object in motion from a resting position. Students investigate and observe both gravitational and electrostatic forces in order to develop working definitions and understandings for each. Finally, students investigate cause and effect relationships of magnet strength, distance and orientation and material interaction. To finalize the unit, the secret agents from the motion detection division complete their evidence logs and go to present their findings to the chief inspector when a new case comes into the division. Students will use their evidence and understandings from the anchor phenomena to solve this new case of odd motion.

Unit Essential Questions:

- What makes objects move the way they do?
- How do different strengths of forces affect motion? How does the direction of a force affect motion?
- How do the properties of an object affect how an object moves when a force is applied?
- How can some unseen forces that act on an object be investigated and explained?
- What can magnetic forces do? How can we use the properties of magnets to solve a problem?
- What forces caused this new case of odd motion?

Learning Sequence # Essential Question	Learning Targets: I can (bold are priority)	Assessment Strategy SR - Selected Response CR - Constructed Response P - Performance O - Observation (behavioral)	Priority NGSS Dimensions			Assessment
(1) What makes objects move the ways they do?	I CAN <ul style="list-style-type: none"> ● Make observations and ask questions about cause and effect relationships of motion-CR 		SEP	DCI	CCC	<ul style="list-style-type: none"> ● Record-share notice/wonder on template

ADDITIONAL CONSIDERATIONS		
COMMON MISCONCEPTIONS	PRIOR KNOWLEDGE NEEDED TO MASTER STANDARDS FOR THIS UNIT	ADVANCED STANDARDS FOR STUDENTS WHO HAVE DEMONSTRATED PRIOR MASTERY
<p>Possible Preconceptions/Misconceptions:</p> <ul style="list-style-type: none"> ● The terms “energy” and force are interchangeable ● If an object is at rest, no forces act on it ● Force is a property of an object ● Large objects always exert a greater force than smaller objects ● Friction always hinders motion, thus reducing friction is always desired ● An object a person is sitting or standing on doesn’t push back with equal force ● If something is moving, there must be a greater force on it ● The faster an object is moving the greater force on it ● Force is a property of an object. An object has force, and when it runs out of force, it stops moving ● All things fall down due to gravity but heavy things always fall fastest 	<p><u>K.PS2</u>. A-C: Pushes and pulls can have different strengths and directions. Pushing or pulling on an object can change the speed or direction of its motion and start or stop it. When objects touch or collide, they push on one another and change motion. A bigger push or pull makes things speed up or slow down more quickly.</p> <p>K-2 ETS1.1: A situation people want to change or create can be approached as a problem to be solved through engineering. Such problems will have many acceptable solutions.</p>	<p>3-5 ETS1-1: Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time or cost.</p> <p>3-5-ETS1-2: Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.</p> <p>3-5-ETS1-3: Plan and carry out fair tests in which variables are controlled and failure points are considered to identify aspects of a model or prototype that can be improved.</p>

UNIT 2 DETAILS

Unit Phenomenon: The Case of Harper's Fossil Find

Storyline: In this unit, the phenomenon is presented under the guise of figuring out the Case of Harper's Fossil Find as students pose as secret agents from the paleontology division. Students look at different fossil types and use their observations to uncover the diet and environment needed for Harper's fossil to survive. Through text and identification of similarities and differences between organisms of different time periods, the students research and explore how paleontologists study and identify relative species through traits. Students have to understand the scale of time and its role in the change in living things as they identify traits found in Harper's fossil to traits found in present day organisms. Students compare and contrast the life cycles of a variety of different living things in order to make a claim about which (present day) life cycle they believe best represents the life cycle of the fossil. By the end of the unit, students will develop a detailed account of the oviraptor fossil and apply learning to describe a new mystery fossil using evidence and traits.

Unit Essential Questions:

- What can we learn from this fossil find?
- What are fossils and what can we learn from them?
- How are organisms today similar and different from their ancestors?
- What patterns can be described in various organism's life cycles?
- Why do offspring look similar to their parents?
- How do environmental conditions impact an organism's traits?

Learning Sequence # Essential Question	Learning Targets: I can (bold are priority)	Assessment Strategy SR - Selected Response CR - Constructed Response P - Performance O - Observation (behavioral)	Priority NGSS Dimensions			Assessment

UNIT 3 DETAILS

Unit Phenomenon: The Case of the Missing Monarchs

Storyline: The unit begins by introducing the case of the missing monarchs to the students. The students preview media and data on the monarch butterfly population to generate questions about the monarch's survival needs and recent population decline, and will ultimately become “experts” in possible causes and effects behind the declining monarch butterfly population. The monarch butterfly has an immense habitat range, and migrates significant distance following daylight and temperature cues. Students will investigate and analyze weather and climate data in monarch habitats and other different regions. They will examine how the monarch and various organisms use adaptive traits and behaviors allowing them to survive, find and mate, and reproduce in specific habitats. Finally, students examine non-weather and weather related changes to environments and how these changes impact organisms to consider how humans can reduce the impacts for positive solutions and outcomes.

Unit Essential Questions:

- How and why is the Monarch population changing?
- Why does the Monarch Butterfly migrate?
- What is the difference between weather and climate? How can climate be described in different regions of the world?
- How do specific traits and behaviors help an organism survive?
- How can non-weather changes to environments impact the monarch butterfly? What can humans do to reduce these changes and impacts?
- How can weather related hazards change environments? How can humans reduce the impact of a drought on the monarch butterfly?

Individual-exit ticket (CFA) in Evaluate ● Record, graph local weather data over the course of one week to explain patterns and make prediction-weather journal template ● Use habitat slideshows for groups to identify and record climate zone information ● Present habitat information, template guide ● Compare climates, identify patterns, follow up to group presentations
<p>(4)</p>	<p>I Can</p> <ul style="list-style-type: none"> ● Make predictions about desirable survival traits per habitat-CR 	<p>SEP</p>	<p>DCI</p>	<p>CCC</p>	<ul style="list-style-type: none"> ● List survival predictions plant and animal with reasoning on thinking

How do specific traits and behaviors help an organism survive in a particular habitat?	<ul style="list-style-type: none"> ● Explain how an organism's adaptive traits help it survive-CR ● Describe how an adaptive behavior helps an organism survive in a particular environment-CR ● Explain and act out how being part of a group helps an animal survive-CR ● Use evidence to explain that variation in traits of the same species may provide a survival advantage-CR. ● Construct an argument from evidence that in a particular habitat, an organism can or cannot survive-CR (CFA) 	<ul style="list-style-type: none"> ● SEP: Use evidence (e.g., observations, patterns) to construct an explanation. ● SEP: Construct an argument with evidence. ● DCI: (LS4.B)- Sometimes the differences in characteristics between individuals of the same species provide advantages in surviving, finding mates, and reproducing. (LS4.C)- For any particular environment, some kinds of organisms survive well, some survive less well, and some cannot survive at all.(LS2.D)-Being part of a group helps animals obtain food, defend themselves, and cope with changes. Groups may serve different functions and vary dramatically in size. ● CCC: Cause and effect relationships are routinely identified and used to explain change. 			frame for specific habitat <ul style="list-style-type: none"> ● Identity and explain organism adaptive survival traits and behaviors in a given climate zone habitat ● Explain and act out group behavior for survival ● Explain with evidence how certain species traits provide survival advantage ● Use picture prompts to construct an argument with evidence that the organism can or cannot survive in a given habitat.
(5) How can non-weather changes to environments impact the monarch butterfly? What can humans do to reduce these changes and impacts?	I Can <ul style="list-style-type: none"> ● List and sort possible causes of environmental change -CR ● Explain the cause and effect relationships of non-weather related changes to the monarch's various habitats-P ● Generate multiple solutions for positive outcomes for the monarch population-P ● Make a claim on the merit of a solution-P ● Make a claim on the effect of fire on a habitat and its organisms-CR 	SEP	DCI	CCC	<ul style="list-style-type: none"> ● Use picture prompt slide to record and then sort causes of environmental change, man made or non-man made ● Performance Task: Explain cause and effect relationships of non weather related changes to monarch habitat with possible solution ● Identify merit of one solution identified by the class that could help local monarchs, considering criteria and constraints ● Use CER to explain effect of fire on habitat

		(ESS3.B)-A variety of natural hazards result from natural processes. Humans cannot eliminate natural hazards but can take steps to reduce their impacts. <ul style="list-style-type: none">● CCC: Cause and effect relationships are routinely identified and used to explain change.				
(6) How can weather related hazards impact environments? How can humans reduce the impact of a drought on the monarch butterfly?	I Can <ul style="list-style-type: none">● Identify weather related hazards and their possible impacts to environments-CR● Explain how a drought would impact the monarch butterfly-CR● Define a problem with criteria, and constraints-P● Follow the steps of the design process-P● Make a claim about the merit of a design solution that reduces the impact of drought on the monarch butterfly-P ● Develop an explanatory model for the migration and decline of the eastern monarch butterfly-P (culminating task)	SEP	DCI	CCC	<ul style="list-style-type: none">● Build a concept map on weather related hazards and impacts to environment● Explain how drought could impact the monarch butterfly● Performance task: Following the engineering cycle, design, build and test a solution for reducing the impact of drought on butterflies ● Develop an explanatory model of monarch migration (culminating task)	
		<ul style="list-style-type: none">● SEP:Obtain and combine information from books and other reliable media to explain phenomena.● SEP: Generate and compare multiple solutions to a problem based on how well they meet the criteria and constraints of the design problem.● SEP: Define a simple design problem that can be solved through the development of an object, tool, process, or system and includes several criteria for success and constraints on materials, time, or cost.● SEP: Make a claim about the merit of a solution to a problem by citing relevant evidence about how it meets the criteria and constraints of the problem.● DCI: (LS2.C)-When the environment changes in ways that affect a place’s physical characteristics, temperature, or availability of resources, some organisms survive and reproduce, others move to new locations, yet others move into the transformed environment, and some die.(LS4.D)-Populations live in a variety of habitats, and change in those habitats affects the organisms that live there.(ESS3.B)-A variety of natural hazards result from natural processes. Humans cannot eliminate natural hazards but can take steps to reduce their impacts.(ETS1.A)-Possible solutions to a problem are limited by the available materials and resources (constraints). The success of a designed solution is determined by considering the desired features of a solution (criteria). Different proposals for solutions can be compared on the basis of how well each one meets the				

		<p>specified criteria for success or how well each takes the constraints into account. (ETS1.B)-Research on a problem should be carried out before beginning to design a solution. Testing a solution involves investigating how well it performs under a range of likely conditions. At whatever stage, communicating with peers about proposed solutions is an important part of the design process, and shared ideas can lead to improved designs.</p> <ul style="list-style-type: none"> • CCC: Cause and effect relationships are routinely identified and used to explain change. • CCC: Engineers improve existing technologies or develop new ones to increase their benefits, decrease known risks and meet societal demands.

ADDITIONAL CONSIDERATIONS		
COMMON MISCONCEPTIONS	PRIOR KNOWLEDGE NEEDED TO MASTER STANDARDS FOR THIS UNIT	ADVANCED STANDARDS FOR STUDENTS WHO HAVE DEMONSTRATED PRIOR MASTERY
<p>Possible Misconceptions:</p> <ul style="list-style-type: none"> • Butterflies do not travel very far • All living things can survive in the same environment • Weather and climate mean the same thing • Climate is similar in different parts of the world • Volcanoes that do not produce lava are not dangerous • All wildfires are bad all of the time • All wildfires occur naturally • Humans do not play a role in reduction of habitat or species 	<p>K.ESS3.A: Living things need water, air, and resources from the land, and they live in places that have the things they need. Humans use natural resources for everything they do.</p> <p>K.ESS2.D: Weather is the combination of sunlight, wind, show or rain, and temperature in a particular region at a particular time. People measure these conditions to describe and record the weather and to notice patterns over time.</p> <p>K.ETS1.A: Asking questions, making observations, and gathering information are helpful in thinking about problems. A situation people want to change or create can be approached as a problem to be solved through engineering. Such problems will have many acceptable solutions.</p> <p>2.LS2A: Plants depend on water and light to grow.</p> <p>2.LS4D: There are many different kinds of living things in any area, and they exist in different places on land and in water.</p>	<p>3-5 ETS1-1: Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time or cost.</p> <p>3-5-ETS1-2: Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.</p> <p>3-5-ETS1-3: Plan and carry out fair tests in which variables are controlled and failure points are considered to identify aspects of a model or prototype that can be improved.</p>
