Beecher Road School Year 3 – Annual Report

Introduction

Energy Systems Group is pleased to provide the Town of Woodbridge and Beecher Road School with this report, which details the energy cost avoidance portion of our joint project. The Guaranteed Year 3 energy savings for this project are \$ 218,497. This amount contains savings from Options A, C and Modified Option C. This report covers the Option A, Option C, and Modified Option C savings for Guarantee Year 3. Although outside of the scope of the project, this report takes into account the impact of electricity generated by the photovoltaic system at Beecher Road School during Year 3.

During Guarantee Year 3, June 2019 – May 2020, Beecher Road School realized total Year 3 cost savings of \$ 292,851. Option C Electric cost savings during Year 3 were \$ 155,046. Cost Savings from Modified Option C fuel switching from #2 fuel oil to natural gas and the new heating system were \$ 130,938. During this time there were also Option A Water Savings of \$ 6,868.

As a result, a grand total of \$ 1,691,509 in energy savings occurred over the past 70 months.

Beecher Road School - Cumulative Savings					
Period	Guaranteed Savings	Actual Electric Savings \$	Actual Fuel Switch Savings \$	Actual Water Savings \$	Total Actual Savings
Construction Period - August 2014 - May 2017	\$ 35,630	\$ 365,147	\$ 459,554	\$ 14,852	\$ 839,553
Year 1 - June 2017- May 2018	\$ 210,012	\$ 131,030	\$ 148,766	\$ 6,601	\$ 286,397
Year 2 - June 2018- May 2019	\$ 214,213	\$ 125,996	\$ 139,979	\$ 6,733	\$ 272,708
Year 3 - June 2019- May 2020	\$ 218,497	\$ 155,046	\$ 130,938	\$ 6,868	\$ 292,851
Total	\$ 678,352				\$ 1,691,509

Beecher Road School Year 3 – Annual Report

This report explains in detail the process by which cost avoidance was determined. It includes summaries of the base year and current utility bills, weather information and what adjustments were made to the base year utility bills. The sole purpose of adjustments are to make an “apples to apples” comparison by taking today's conditions and applying them to the base year, in order to accurately compare today's utility bills with those of the base year prior to the upgrade projects.

Project Background

The Energy Conservation Measures (ECM's) and building upgrades implemented for this project included:

- Lighting and Lighting Sensors Retrofit
- Mechanical Upgrades
 - New chilled water plant providing cooling throughout the school
 - New Pool dehumidification unit
 - Upgrades to air distribution system, including replacement of Roof Top Units, Air Handling Units, Variable Air Volume boxes, and Unit Ventilators
- Building Control Upgrades (Direct Digital Control Building Management System)
- Demand Control Ventilation
- Building Envelope Improvements (weather-stripping, sealing and insulation)
- Plug Load Controls
- Walk-In Freezer and Cooler Controls
- Transformer Replacement
- Water Conservation Measures (installation of low flow fixtures)
- Micro-Turbine that uses Natural Gas to generate electricity and utilizes the waste heat for pool water heating, domestic water heating, and building space heating in the winter time
- Replacement of Curtain Wall
- Roof Replacement
- Casework in ABC and K Wing
- Building Security Upgrade Measures (Includes Security Doors, Visitor Management System, Access Control System, Camera and Intercom System)
- Installation of New Canopy at the North and South Entrances of the School
- Wall Painting
- Equipment Commissioning

Beecher Road School Year 3 – Annual Report

These measures enabled Beecher Road School to increase system efficiency and performance, reduce the energy consumption, and improve the indoor environment for occupant comfort and security. As outlined in the Exhibit B Measurement and Verification Plan for this project, Energy Savings verification for this project was completed using IPMVP Option C and Modified Option C Methodology. This methodology utilizes utility bill analysis in order to calculate Cost Avoidance as detailed in this report. Verification of savings that result from Water Conservation measures was completed using IPMVP Option A Retrofit Isolation: Key Parameter Measurement methodology. The Option A savings were verified through on time pre-and post-retrofit water flow rates in sample fixtures and engineering calculations.

Executive Summary

This comprehensive report shows energy consumption savings for those buildings associated with our joint project. The analysis was accomplished using EnergyCAP® energy accounting software to enhance the quality of the report in conjunction with MS-Excel. EnergyCAP® incorporates weather, billing period length, square footage and utility rate changes to provide the most accurate analysis of energy cost avoidance possible.

Energy Systems Group began the installation of energy saving upgrades to equipment in May 2014, with final acceptance of this project given by Beecher Road School in May 2017. With this project, came a guarantee of energy savings worth **\$3,667,462** over 15 years. The following table shows the cost avoidance to date.

Beecher Road School
Year 3 – Annual Report

Beecher Road School - Cumulative Savings		
Period	Guaranteed Savings	Actual Savings
Construction Period* - August 2014 - May 2017	\$ 35,630	\$ 839,553
Year 1 - June 2017- May 2018**	\$ 210,012	\$ 286,397
Year 2 - June 2018- May 2019**	\$ 214,213	\$ 272,708
Year 3 - June 2019- May 2020**	\$ 218,497	\$ 292,851
Total	\$ 678,352	\$ 1,691,509

*Note: The Guaranteed Savings for the Construction Period was \$35,630 of Agreed Upon Energy Savings. The Construction Savings summary in the Year 1 report is for informational purposes only.

**Year 1 -Year 3 Savings include the impact of electricity generated by the photovoltaic system at Beecher Road School.

Utility Rates

Rates used to calculate savings are presented in the table below. Rates used to calculate Fuel Switching and Natural Gas savings are presented in the Fuel Switching Methodology Section.

Commodity	Baseline	Escalated Base	Current	Year 3 Rate Used to Calculate Savings
Option C Electric (\$/kWh)	\$0.1984	\$ 0.2064	\$0.1875	\$0.2064
Option A Water (\$/kGal)	\$ 6.41	\$ 6.67		\$ 6.67

Option A - Water System Savings

Option A “Retrofit Isolation: Key Parameter Measurement” was used in the verification of water system improvements at Beecher Road School. The verification was performed through one-time pre- and post-retrofit water flow rates in sample fixtures and engineering calculations and was presented in the Year 1 Report. The annual cost savings will be carried forward escalating annually as outlined in Section 4.1 of Exhibit B of the contract.

Beecher Road School Option A Water Savings				
	Gallons	Rate (\$/kgal)	Achieved Savings \$	Guaranteed Savings \$
Year 3 Option A Water Savings	1,029,802	\$6.67	\$ 6,868	\$ 3,964

Option C and Modified Option C

Measuring Energy Savings Through Cost Avoidance

The measurement of energy consumption and the cost savings associated with installed energy management equipment is a comparison between the energy consumed during the current billing period and the respective baseline billing period.

The first step in cost avoidance calculations is the creation of a baseline. The baseline reflects the facility’s energy use and energy costs prior to the installation of the energy conservation measures. The baseline calendar period will typically be a consecutive twelve month period for which reliable data exists prior to contract execution. The baseline will consist of all energy bills applicable to the meters in the project. For Beecher Road School, July 2011 – June 2012, was used as the base year.

Once the program is in place, actual energy use is recorded from current utility bills. The costs that the facility incurs after implementation of the measures are compared to the baseline in order to determine if savings projections--and guarantees--have been met.

Baseline Adjustments

Proper analysis and comparison can only be achieved if the environmental and facility parameters are equal to those of the base year. Examples of factors effecting the environment and facility parameters are weather, energy rates, facility schedules and changes in equipment. The baseline may need to be adjusted to equalize the parameters of the current year so that an accurate analysis can be performed and valid savings can be measured. In essence, the adjustment process shows what the costs and usage would have been in the base year under the current conditions for an ‘apples to apples’ comparison.

These adjustments typically cover:

- standardize for the number of days in a billing period
- normalize the differences in outdoor temperature through degree days
- changes in facility occupancy and use
- additions or deletions of energy using equipment
- changes in energy prices and/or rate structures

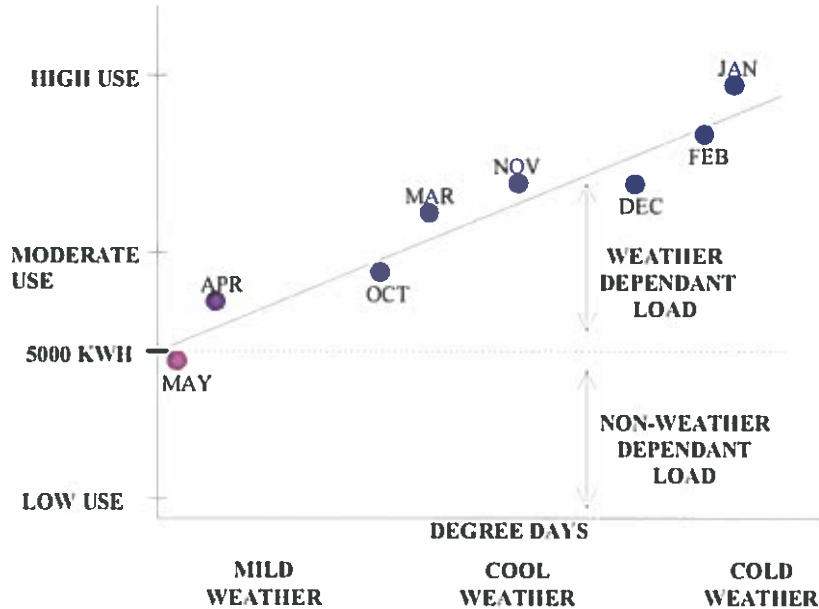

Auditing Energy Savings

ESG uses EnergyCAP®, a computerized energy accounting database to track cost and consumption during the guarantee period. Once a baseline is established, and entered into the program, EnergyCAP® uses this as the benchmark for contract performance.

EnergyCAP® will automatically adjust for differing number of days in the billing period before calculating performance. The software’s processors adjust for weather variations using degree days while still recognizing that not all energy consumption is weather-related.

Beecher Road School Year 3 – Annual Report

EnergyCAP® WEATHER ADJUSTMENT MODEL SAMPLE

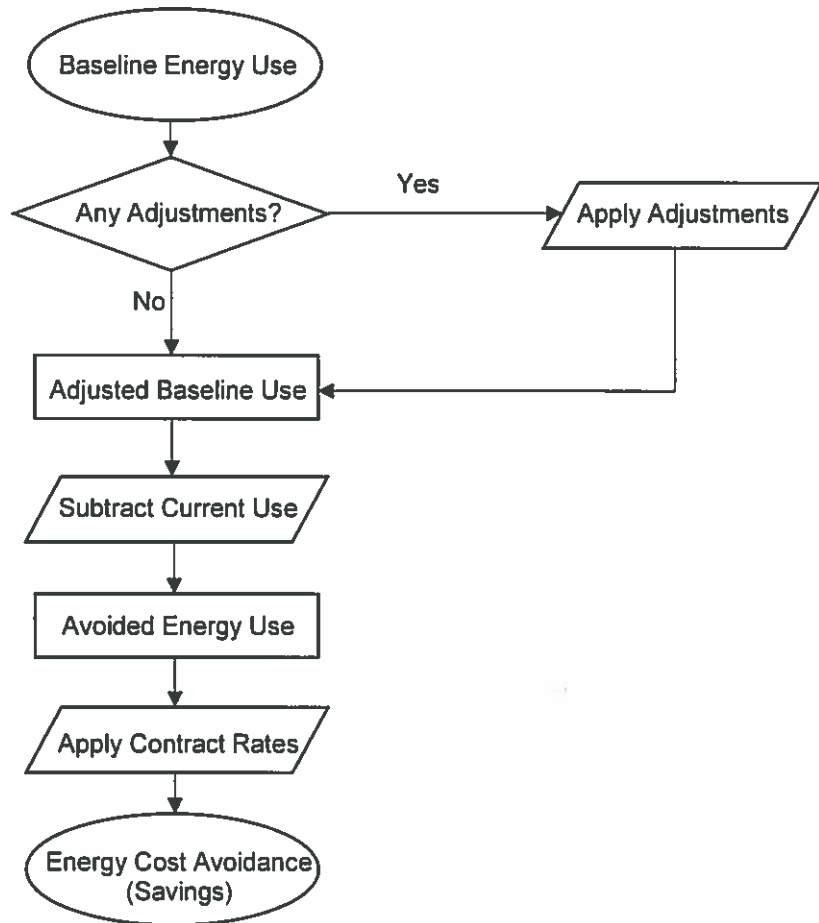

After EnergyCAP® adjusts for weather and billing period, it allows additional adjustments to be made for items such as changes in equipment or occupancy. Changes in equipment can be removal of or an addition to existing equipment or operating hours.

Once all adjustments are taken into account, EnergyCAP® then produces the new baseline units of energy (adjusted baseline). The current energy consumption is then subtracted from the adjusted baseline to determine avoided energy units. The energy rates as agreed in the contract are then applied to avoided energy units to determine cost avoidance.

Beecher Road School Year 3 – Annual Report

A summary of the calculation process for cost avoidance is as follows:

Methodology for Assigning Dollar Values to Savings:

Assigning dollar values to savings will be accomplished by using an average cost per unit of energy. Charges for fuel adjustments, base services, transmission, tariffs, and distributions will be included to ensure an 'apples to apples' comparison. This method also allows for updating savings calculations with changing rate schedules. In the event of a utility rate decrease, the utility rate(s) used to assign dollar cost will not drop below that of the base year. In this project, savings have been guaranteed in dollars, not units of energy, therefore, a lower limit, or floor, must be set to that of the base year rate schedules.

The following pages graphically illustrate the actual energy usage of the base and guarantee years, and the resulting impacts of any adjustments to the base year (adjusted baseline).

It is noted that during the months of March, April and May 2020 it was observed that there was lower electric consumption than for the same months of 2019. The difference in kWh consumption was approximately 69,500 kWh valued at \$14,345. It is noted that the COVID-19 pandemic occurred during this time frame. No adjustments were applied in this report for this change in consumption.

Beecher Road School Year 3 – Annual Report

Fuel Switching Methodology

Detailed Fuel Switching Modified Option C Methodology may be found in excerpts of Exhibit B, Section 4 of the contract; or at the end of this report.

Fuel Switch Savings \$ = (Current Year Consumption or Fuel Oil Equivalent Baseline 83,404 Therms, whichever is greater) x (the Baseline Fuel Cost Savings difference value escalating 2% annually in \$/Therm)

	Current Year Therm Consumption	Fuel Oil Equivalent Baseline Therms	Fuel Switch Dollar Savings
Jan-20	13,718	25,330	\$ 18,831

831,365	Total kWh used by Beecher Road School during Year 3 = Metered Grid Consumption + Solar Production used at Beecher Road School
---------	---

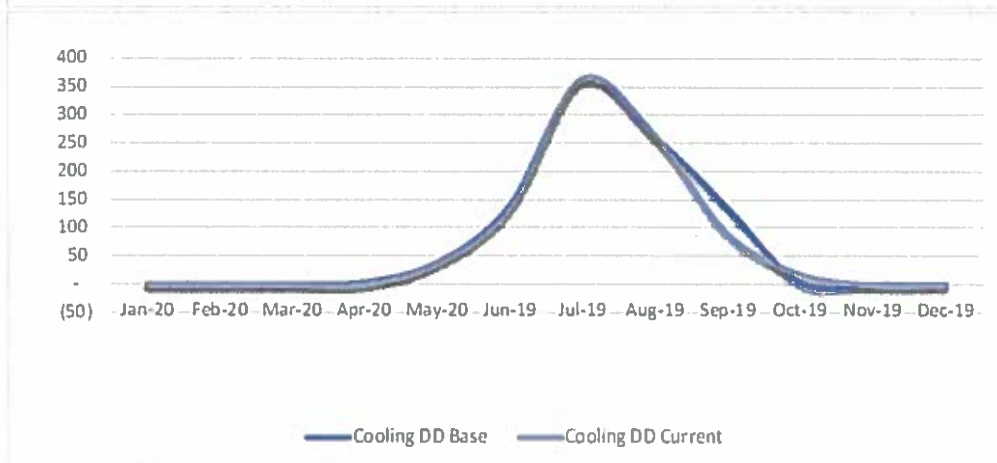

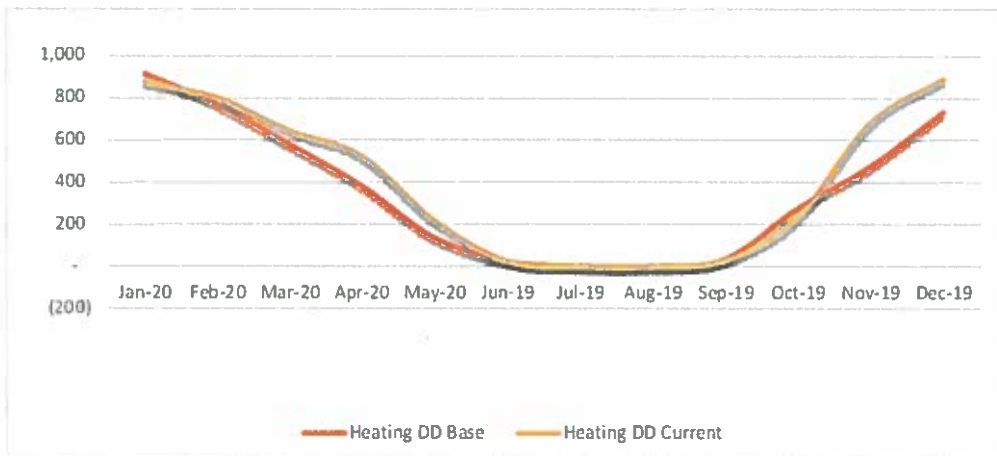

Total Year 3 Electric Consumption includes kWh purchased from the utility (grid use) and kWh generated by the solar power system that was used by Beecher Road School. Grid kWh consumption as listed on the utility bills is a sum of the North and South Meter reads. The South Virtual Meter represents the solar production kWh that is sold to the grid. Therefore, in order to determine Year 3 kWh generated by the solar power system that was used by Beecher Road School, the South Virtual Meter kWh exported to the grid were deducted from the total kWh produced by the solar power system. The grid use was then added to the solar production used by the school, resulting in 831,365 total kWh used by Beecher Road School during Year 3. The Year 3 Electric Grid rate is \$0.1875/kWh, which was the rate used to calculate the value of the solar production used by Beecher Road School during Year 3.

APPENDIX

Beecher Road School Year 3 – Annual Report

During a recent internal review, we discovered an error in the savings methodology we used to calculate the energy savings we reported to you. The error resulted in ESG reporting higher savings than the method prescribed in the contract would have reported. ESG has recalculated the savings based on the contract terms. The corrected calculations still show ESG delivered more than the guaranteed savings, but by a smaller margin than originally reported. A summary of the annual reconciliation is attached. The corrected yearly savings is reflected in this Year 3 Annual Report.

In the original report, the savings measured using the M&V Option C Methodology were not calculated in accordance with the methodology specified in the contract. The contract establishes an energy unit cost floor value to be used in calculations in the unusual situation in which energy costs fall over time. The calculated savings using the actual energy costs were in some years more than the calculated savings using the contractual floor price. The result was an overstatement of reported savings. Although, we are still meeting the guarantee and this has no contractual or financial implications, we wanted to make you aware of the error and provide you the restated annual savings.

We apologize for this error and for any inconvenience it may have caused.

Woodbridge School District, Beecher Road School– Recalculation of Savings

Note 1: The above table lists energy savings values during the M&V term. The actual finance term included in the project cash flow may be longer than the M&V term indicated in the above table and hence the total savings in the project cash flow may be different. The above table simply represents the guaranteed values through the M&V term.

Note 2: The Guaranteed Energy Savings is for total cost savings and not by ECM or fuel type.

4.1 ESCALATION RATES

The minimum annual escalation rates listed below are agreed upon as part of the guaranteed energy savings listed in Table A and for M&V and O&M costs listed in the financial section of the proposal. ESG and OWNER agree to the escalation rates listed in Table A-2 below.

Table A-2 – Escalation Rates

Energy Cost Escalation./year	2.0%
Labor Cost Escalation/year	3.0%
Maintenance Cost Escalation/year	3.0%

The actual escalation of calculated savings that will be applied in the M&V Report will be the *higher of*:

- (1) Table A-2 above
- (2) CPI (Consumer Price Index) for the geographical region, or
- (3) Actual fuel rate

The escalation rates include the general inflation rates. The escalation of unit utility and maintenance rates begin following the end of the *Baseline Period* for the project.

Table B – Baseline Information

Building	Account Number	Energy Type	Gross Area, sq ft	Base Unit Cost	Baseline Use		
				\$/Unit	Units	Use	Cost
Beecher Road School	90000000066	Electric Baseline	150,000	\$0.1984	kWh	1,131,238	\$ 224,438
		Electric - Modified Adjustment ^(a)				455,562	\$ 90,384
	N/A	Fuel Oil		\$2.7300	gallon	59,830 ^(b, c)	\$163,336
	Natural Gas	Natural Gas ^(a)		\$0.6390	therm	83,403 ^(c)	NA
		Natural Gas - Modified Adjustment		\$0.6390	therm	48,585 ^(e)	NA
	210146991	Water		\$3.8400	kgal	3,328	\$12,779
		Sewer		\$2.5700	kgal		\$8,553

- a) As of January through November of 2013, the average natural gas rate is at \$0.639 per therm
- b) #2 Fuel Oil heating value of 139,400 Btu/gallon
- c) The baseline value includes space heating only and excludes increased fuel purchase for micro turbine
- d) The energy use values shown in Table B include the estimated increase in energy use (i.e., Modified Adjustment) from pool dehumidification, and cooling system. The Modified Baseline values for the school will be the sum of the Baseline (1,131,238 kWh) and the Modified Adjustment (455,562 kWh) values shown in the above table.
- e) Estimated net gas use of the proposed micro turbine. Modified Baseline value is the total of 83,403 + 48,585 = 131,988 therms/year
- f) The Modified Baseline values shown in Table B include the estimated increase in energy use from pool dehumidification, cooling and the natural gas for the CHP unit. The Modified Baseline values shown above will be the baseline values for the school in the performance period.

Modified Baseline Monthly Use

The following table provides monthly use of Modified Baseline values of electric, oil and natural gas for information only.

**Table B-1. Modified Baseline Monthly Utility Use
(for electric and fossil fuel only)**

Baseline Year - 2011 - 2012

Month	ELECTRIC		FOSSIL FUEL			
	Electric Utility Bill Based kWh	Electric Modified Baseline kWh	Oil Utility-Bill Based Baseline gallons	Equivalent Baseline therms	Estimated Micro-Turbine Use therms	Total Modified Baseline Therms
Jul-11	52,775	118,200	271	378	4,126	4,504
Aug-11	80,807	116,600	271	378	4,126	4,504
Sep-11	93,889	155,200	271	378	3,993	4,371
Oct-11	93,779	162,400	271	378	4,126	4,504
Nov-11	97,012	137,400	6,271	8,742	3,993	12,735
Dec-11	109,338	110,500	11,483	16,007	4,126	20,134
Jan-12	95,718	132,100	18,171	25,330	4,126	29,457
Feb-12	94,284	124,600	3,731	5,200	3,727	8,927
Mar-12	107,068	120,700	14,606	20,361	4,126	24,487
Apr-12	101,634	122,900	3,172	4,422	3,993	8,415
May-12	99,514	153,000	271	378	4,126	4,504
Jun-12	105,420	133,200	1,042	1,452	3,993	5,445
Total	1,131,238	1,586,800	59,830	83,403	48,585	131,988

Fuel Switching

As part of the project, ESG has recommended switching the fuel from #2 fuel oil to natural gas. Changing the fuel type will yield savings by significantly reducing the cost per Btu based on current market conditions, as reflected in Table C.

Table C – Energy per Dollar Equivalents Guarantee Year One

Energy Type	Dollar per Btu Equivalents			100,000 X \$/Btu = \$/therm
	Utility Costs per Unit	Btu Content/Unit	\$/Btu	\$/therm
#2 Fuel Oil	\$ 2.7300/gallon	139,400 Btu/gallon	\$ 0.000019584/Btu	\$ 1.9584/therm
Natural Gas	\$0.6390/therm	1,000 Btu/ft ³	\$ 0.00000639/Btu	\$ 0.6390/therm
Difference				\$ 1.3194/therm

Savings Calculation

There are two components of savings associated with converting from #2 fuel oil to natural gas. They are the cost (dollars) saved on Fuel Switching by paying less per Btu and the dollars saved from the efficiency of the upgrades. In order to accurately capture both savings components ESG will calculate the Fuel Switching savings utilizing a modified version of IPMVP Option C.

In calculating Fuel Switch savings ESG will collect and enter utility bill invoices from the base year and current year to capture and calculate Fuel Switch savings. These savings will simply be either:

the current year consumption or 83403 therms, whichever is greater x the Baseline Fuel Cost Savings (difference) value (escalating) as listed in Tables C and A-2 annually, beginning in the Year following Baseline Period.

The second component of savings associated with the Fuel Switching project comes from the Efficiency Savings from the proposed upgrades. In order to calculate these savings ESG will once again utilize methodology similar to IPMVP Option C by utilizing a utility bill consumption analysis to derive the Therm Savings in each Guarantee Period. The calculation for Efficiency Savings will be:

the [(Adjusted Baseline Therms – Current Year Therms) or the (Baseline Therms – Current Year Therms), whichever is greater] x the Baseline Avoided Energy Cost annually escalating beginning in the Year following the Baseline Period as listed in Tables C and A-2 or Guarantee Year Average Unit Cost of #2 Fuel Oil converted to \$/therms, whichever is lower.

The fuel switching cost reduction dollars and the efficiency dollars then will be added to other utilities that are utilizing the Option-C methodology to create a total Option-C calculated savings amount.

Below are the equations for the Measurement and Verification Methodology listed above.

Defined Variables

Rate Escalation Defined in Table A-2

Baseline Fuel (#2 oil) Cost Savings (difference) as defined in Table C at \$1.3194/therm

Baseline Avoided Energy Cost as defined in Table C at \$1.9584/therm

Guarantee Year Average Unit Cost Difference = (Guarantee Year Average CPI of (#2 oil) expressed in \$/therm – Guarantee Year Average Cost of natural gas expressed in \$/therm)

Projected Calculated Consumption = 83,403 therms/year (baseline use without the micro turbine gas use, please refer to Table B-1)

Fuel Switching

The approach discussed above is presented in the following equations.

$$(1),(2) \text{ Fuel Switch Savings} = (\text{Current Year Consumption or } 83,403 \text{ Whichever is Greater}) \times ((\text{Baseline Fuel Cost Savings (difference; } \$1.3194) \times (1 + \text{Energy Escalation Rate})^{(\text{Guarantee Year})}),$$

(1) Consumption value is in therms, and the cost difference is \$/therm

(2) The First Guarantee Year = 0, then the series will sum +1 for every proceeding guarantee year

Energy Efficiency Upgrade Savings

$$\text{Therms Saved} = (\text{Adjusted Baseline} - \text{Current Year Consumption}) \text{ or } (\text{Baseline} - \text{Current Year Consumption}), \text{ whichever is greater}$$

⁽¹⁾ Adjusted Baseline = Modified Baseline ± Routine Adjustments ± Non Routine Adjustment

(1) Adjustments are described in Section 4.2 of this contract.

Energy Efficiency Cost Savings = Therms Saved x Guarantee Year Average CPI for #2 fuel oil or (Baseline Avoided Energy Costs (\$1.9584) x(1 + Rate Escalation)^(Guarantee Year)), whichever is lower

Total Modified Option-C Savings

Total Annual Dollar Savings = Fuel Switch Savings + Energy Efficiency Upgrade Savings

4.2 Adjustments to the Guarantee. The Guaranteed Savings will be adjusted to account for material changes, where material is defined as any change or changes that may increase or decrease the energy consumption of the Facilities by more than 1% annually, including, but not limited to the following:

- a. Changes in the hours of operation of any buildings constituting any part of the Facilities.
- b. Changes in the occupancy of the buildings constituting any part of the Facilities.
- c. Changes in the structure of buildings constituting any part of the Facilities, such as architectural features or building components.
- d. Modifications or renovations to the buildings constituting any part of the Facilities, which may or may not change the conditioned space.
- e. Changes to the ECMs.
- f. Changes in utility prices, rate structure, or average unit cost values as listed in this Exhibit
- g. Change in utility suppliers or utility type(s)
- h. Change in the method of utility billing or purchasing that affects utility costs with respect to the Facilities.
- i. Addition or deletion of energy consuming equipment at the site.
- j. Weather variance from base year to current year.
- k. CUSTOMER's failure to adhere to operating and maintenance responsibilities as defined by the equipment manufacturer.
- l. Adjustments necessary to account for lighting burnouts as documented before retrofit.
- m. New outside air ventilation needed to bring any buildings constituting any part of the Facilities up to state government code or recommendations after Final Acceptance.
- n. Required increases in light levels to bring any buildings constituting any part of the Facilities up to state government code.
- o. Any condition, which affects the energy demand or consumption of Facilities, caused by CUSTOMER or its agents.

ESG will be responsible for obtaining from OWNER notice of actual or proposed material changes to the site and its anticipated effect on energy usage and consumption.

OWNER agrees to:

- a. Notify ESG of changes to the initial building control's system program upon prior notice from ESG.
- b. Not place the building control system in a permanent 'on' status, nor will OWNER manually operate or override any part of the building control system except upon equipment failure or emergency conditions.
- c. Provide ESG access to the facility when required to inspect and adjust ECMs to ensure optimal operation and maximum energy savings.
