

### **Similar School District Performance Review Data, ELA and Math**

District 90 completed a project in June 2024 with the assistance of Eric Isenberg (Board Member) and Phil Earvolino (D90 contract statistician) to identify Illinois school districts with traits/characteristics “similar” to those of District 90. The goal was to create a list of peer districts with comparable attributes that can be used to discern the degree to which District 90 obtains student achievement outcomes on the IAR relative to those peers. It is important to note that the group of comparison districts identified as “similar” differs when considering ELA and Math performance.

Generally, there is great variability between school districts, which contributes to the challenge of isolating individual districts with common attributes. Please see the attached report describing the process that was used to accomplish this objective. The resulting list of identified “similar” districts follows:

#### ***English Language Arts***

Libertyville SD 70  
La Grange Highlands SD 106  
Deerfield SD 109  
Avoca SD 37  
**River Forest SD 90**  
Aptakisic-Tripp CCSD 102  
Lake Bluff ESD 65  
Frankfort CCSD 157C  
Park Ridge CCSD 64

#### ***Math***

La Grange Highlands SD 106  
Arlington Heights SD 25  
Glen Ellyn SD 41  
Lake Bluff ESD 65  
Glenview CCSD 34  
**River Forest SD 90**  
Naperville CUSD 203  
Lake Zurich CUSD 95  
Indian Prairie CUSD 204  
Frankfort CCSD 157C  
Geneva CUSD 304

### **IAR Custom Peer Group Achievement Comparisons**

District 90 contracted with a data analytics firm, LinkIt!, again this year to assist in gathering and compiling the relevant IAR student achievement data to allow for longitudinal performance comparisons with the similar districts. Separate data reports for ELA and Math are attached. In ELA, D90 performed at or above the level of 6 comparable districts, and slightly below 2 others.

In Math, D90 outperformed 9 out of 10 comparable districts when considering aggregate performance across the 3-8 grade span, in many cases by double digits. One notable difference between the ELA and Math comparison groups is in student enrollment. The Math comparison districts tend to have larger enrollment and higher percentages of EL and Low-Income students relative to D90. Special education enrollment rates tend to be markedly similar, overall.

### **5-Year Percentile and Ranking Comparison**

This report provides longitudinal data for District 90 related to other districts in Illinois, Cook County, and West Cook ISC (ROE#6). These rankings reflect the percentage of students achieving “Meets and Exceeds” on the IAR. Please note that the higher the percentile the better D90 compares to statewide results, which produces a higher ranking represented by a lower number with 1 being the highest rank possible. There are numerous points of pride reflected in this report as well as opportunities for growth. However, please see the aggregated G3-G5 ELA statewide achievement ranking for the 2024-25 school year; District 90 ranked 3<sup>rd</sup> in the entire state of Illinois.

The administrative team will be using this data for the purpose of school improvement planning, targeting groups of students for intervention and/or enrichment, and to further inform instructional decision making, where appropriate.

*District 90*

Similar School District  
Performance Modeling  
(Math, ELA)

## **Motivation**

River Forest School District 90 is interested in finding other school districts with similar characteristics to determine their relative effectiveness in impacting student achievement levels on the 2023 IAR assessment. The analysis must not only identify these similar districts and evaluate them relative to River Forest, but compare actual achievement to that predicted by an analytical model. We propose that a linear regression model will satisfy these criteria.

### **Universe of school districts:**

The candidates for comparable models are the five Chicagoland collar counties, not including Chicago Public Schools.

The initial set of independent variables consists of:

Percent enrollment of Black/African American students;  
Percent enrollment of Hispanic students;  
Percent enrollment of Asian students;  
Percent enrollment of multiracial (two or more races) students;  
Percent enrollment of students of unknown ethnicity (in the case of small districts, ISBE withholds information on certain groups for privacy purposes);  
 $(\text{Log of student enrollment})^2$ ;  
 $(\text{Log of student enrollment})^2$  (in both of these cases the enrollment figure is transformed to reduce the effect of outliers, i.e. very small or large districts);  
Log of household median income;  
Percentage of parents with bachelor's degree;  
Percentage of students in owner-occupied housing;  
Percentage of students with IEP's;  
Percentage of students who are ELL (English language learners);  
Percentage of students in low income households.

### **Standardization of scale scores:**

For each content area and grade, scale scores are converted to z-scores. For each content area, all scores are averaged on a per-student basis.

**Missing values:**

ACS values (median income, percent bachelor's degree, and percentage of students in owner-occupied housing) are unavailable for smaller districts. We have not attempted to estimate these, so these districts are not included in the analysis.

**Results:**

Weighted least squares (WLS) regression (where district enrollments are weighted) yields high  $R^2$  values : 0.808 for ELA; 0.878 for Math. Using the regression coefficient results permits us to generate a group of districts for which predicted assessment scores are similar to those for River Forest, where two degrees of similarity are defined: z-scores within  $\pm 0.1$  of River Forest's, and those which are within  $\pm 0.05$  of River Forest's. It also enables us to check residuals (the difference between the predicted and actual scores) to determine if River Forest and the other like districts have outperformed or underperformed their scores as predicted by the regression analysis.

### Similar School Districts (Math)

School District	Predicted z-score

## **Selecting comparable districts to River Forest Elementary District 90 and analyzing performance of District 90 compared to comparable districts**

**Goal:** Be able to compare the academic performance of District 90 to comparable school districts to better understand how District 90 performs relative to peers for performance in the aftermath of the pandemic—in the 2022-23 and 2023-24 school years, with the ability to continue to compare our performance to peer districts in future years. If we identify comparable districts that are outperforming ours, we may be able to learn from them.

**Districts to consider in pool of potentially comparable districts:** As an elementary school district in suburban Chicago, District 90 should be measured against other suburban elementary school districts. That is, the pool of potential “comps” should include all elementary school districts in Cook County and the five collar counties around Cook County (DuPage, Kane, Lake, McHenry, Will). As a large unit district, Chicago Public Schools will not be considered as a potential comparable district.

**How to select comparable school districts:** We consider a comparable district to be school district with the combination of resources and demographic characteristics that allow it to achieve comparable academic outcomes to a district with the resources and demographic characteristics of District 90. Because no two school districts have are exactly alike, it's important to consider how the combination of characteristics work together to produce student achievement.

**District characteristics:** It will be important to select characteristics that predict the academic performance of students in a school district. Therefore, we will consider the following characteristics, with the source indicated in parentheses:

- Student enrollment (Illinois school report card)
- Racial/ethnic composition:
  - Percentage of Black students (Illinois school report card)
  - Percentage of Hispanic and Native American students (Illinois school report card)
  - Percentage of Asian and Pacific Islander students (Illinois school report card)
  - Percentage of multi-racial students (Illinois school report card)
- Percentage of English learners (Illinois school report card)
- Percentage of students with IEPs (Illinois school report card)
- Percentage of students eligible for a free or reduced-price lunch (Illinois school report card)
- Percentage of public-school children in married couple households (American Community Survey [ACS])
- Median household income of parents of public-school children (ACS)

- Percentage of parents of public-school students in owner-occupied housing (ACS)
- Percentage of parents of public-school students in which the parents have a bachelor's degree or higher (ACS)

**Method:** The goal for this method is to arrive at an apples-to-apples comparison of achievement in District 90 against a group of comparable districts by comparing how District 90 actually scores to how the comparable districts actually score. The method uses this small group of characteristics to predict the average achievement of students in a school district. Some districts will exceed what would be predicted based on their characteristics; other districts will score less than what would be predicted based on their characteristics. The key is to create a group of comparable districts by selecting districts that, based on their characteristics, would be predicted to score the same or nearly the same as District 90 would be predicted to score based on its characteristics.

**Steps (shown for English language arts but will be repeated for math and science):**

- **Translate the percentage of students scoring at each proficiency level into a single summary measure of achievement.** Using data from spring 2023 IAR testing, create a summary measure of achievement for each grade across grades 3 to 8 for English language arts using the methodology of Reardon and Ho (2012)<sup>1</sup> to estimate the number of standard deviations of difference of each district from River Forest D90 based on five categorical scores for each outcome. Then average the 6 grade-level estimates to create a single summary measure for English language arts.
- **Transform the predictive variables into measures that will have greater predictive power.** Convert student enrollment to two variables:  $\ln(\text{student enrollment})$  and  $[\ln(\text{student enrollment})]^2$  to capture the possibility of an optimal enrollment size while reducing the potential role of outliers. Convert median household income into  $\ln(\text{median household income})$  to better model the relationship between income and achievement and reduce the potential role of outliers.
- **Regress the summary measure on the predictive variables.** Weigh each school district by its student enrollment for more efficient estimates.

---

<sup>1</sup> Ho, A. D., & Reardon, S. F. (2012). Estimating Achievement Gaps From Test Scores Reported in Ordinal "Proficiency" Categories. *Journal of Educational and Behavioral Statistics*, 37(4), 489-517.  
<https://doi.org/10.3102/1076998611411918>

- **Predict achievement for each district based on its characteristics.**  
Using the coefficients from the regression model, predict the summary achievement measure for each district.
- **Choose the 20 school districts with the closest *predicted* summary achievement measure to District 90.**
- **Compare the actual performance of comparable districts to District 90.** Both individually and in the aggregate, display the **actual** achievement of these 20 districts to the actual achievement of District 90 (zero by definition).
- **Repeat with 2024 data.** Use the steps listed above to repeat the comparison of actual achievement of these districts to District 90 using data from spring 2024 IAR testing when the data become available.

## Data Warehousing

Collect, store, and analyze all your data sets with easy-to-use reporting and data visualization capabilities for a more holistic view of student learning

## Navigator Analytics

Advanced custom reporting and consulting service that identifies patterns and trends to improve decision making and data fluency

## Assessment Solutions

Full support for online and paper-based test administration, advanced test authoring tools, and an extensive content library of benchmark assessments, item banks, and progress monitoring tools

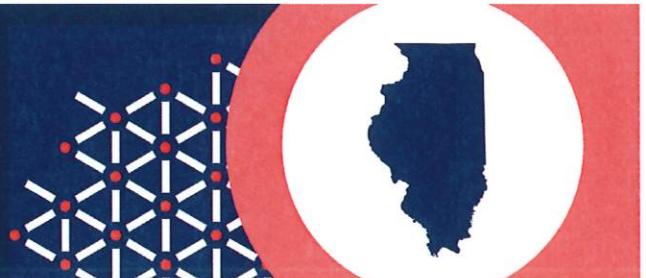

## Intervention Manager

An online management suite to support and enhance your processes for MTSS/RTI, Gifted, ELLs, and 504

# **Table of Contents**

- Section 1: District Overview - pg. 4
- Section 2: ELA Percentiles & Ranking - pg. 7
- Section 3: Math Percentiles & Ranking - pg. 13

## Section 1

# District Overview

Statewide percentiles rank districts by the percentage of students achieving a proficient score on the IAR. This score is defined as follows:

- For years 2021–22 through 2023–24: The proficient score includes the Meets Expectations (Level 4) and Exceeds Expectations (Level 5) performance levels.
- For the 2024–25 school year and onward: The proficient score includes the Proficient (Level 3) and Above Proficient (Level 4) performance levels, following the state's transition to a new four-level reporting system. Due to this change in the performance levels and corresponding cut scores, proficiency rates from 2024–25 forward are not directly comparable to prior years.

A higher percentile indicates better district performance relative to statewide results. The final district rank is presented as a whole number, where 1 is the highest possible rank and represents the strongest performance.

# 5-Year District Percentiles

ELA	# of Districts	Statewide Ranking	All Grades
			Statewide Percentiles
2020-21	739	43	94
2021-22	746	36	95
